## Abstract

**Purpose** – This paper presents a theorization and an empirical analysis of the influences of international open innovation (IOI) on the international market success of emerging market small and medium-sized enterprises (ESMEs). An analysis of the moderating roles played by cross-cultural competencies and digital alliance capabilities in this specific context is also presented.

**Design/methodology/approach** – The study adopted a quantitative research design involving a survey of 231 ESMEs based in the UAE. The authors formulated some hypotheses and tested them by employing hierarchical regression models.

**Findings** – The findings revealed that IOI positively affects the international market success of ESMEs. The authors further found that both cross-cultural competencies and digital alliance capabilities moderate the relationship between IOI and international market success.

**Originality/value** – The study advances the international marketing, knowledge and innovation management literature in two ways. First, it is a pioneering study that advances both the theoretical and empirical scholarship regarding the relationship between IOI and emerging market firm international market success by employing an extended resource-based view. Second, it further highlights the role played by cross-cultural competencies and digital alliance capabilities as effective governance mechanisms that moderate the relationship between IOI and international market success.

**Keywords** Cross-cultural competencies, Digital alliance capabilities, Emerging market, International open innovation, International market success, SMEs, Resource-based view

**Paper type** Research paper

## 1. Introduction

Over the past few decades, small and medium-sized enterprises (SMEs) have become important players in the international business landscape (Oehme and Bort, 2015; Paul and Rosado-Serrano, 2019; Sui and Baum, 2014). This is particularly true of SMEs from developed countries, which usually possess country-specific competitive advantages (e.g. technological advancement and efficient transportation and communication) that they quickly utilize and transpose to international markets (Del Giudice *et al.*, 2017; D'Angelo *et al.*, 2016; Li *et al.*, 2018). Conversely, emerging market SMEs (ESMEs) are often characterized by weak home-based competitive attributes when doing business internationally (Scuotto *et al.*, 2020b; Xiao *et al.*, 2020). By definition, ESMEs are characterized by liabilities of newness and emergingness, which result in them lacking a competitive edge over their rivals in the international marketplace (Rahman *et al.*, 2017; Zhang *et al.*, 2014). Thus, compared with their competitors from advanced economies, ESMEs are often at a disadvantage in regard to achieving international market success due to their lack of technical knowledge and skills (Khan and Lew, 2018; Puthusserry *et al.*, 2020). Despite the increasing prominence of ESMEs, little is known about what drives their international market success in competitive marketplaces, which is illustrated by their rapid expansion into foreign markets.

Scholars have demonstrated the importance of international strategic alliances in driving SME international market success (Kafouros and Forsans, 2012; Li *et al.*, 2017). Such alliances provide access to valuable knowledge and help to co-create idiosyncratic resources suited to the achievement of economic success and international competitiveness (Ferrerás-Méndez *et al.*, 2019; Musteen *et al.*, 2014; Sheng and Hartmann, 2019). In addition, the innovation literature recognizes that the establishment of ties with international partners facilitates the development of innovation (Romero-Martínez *et al.*, 2017), which is vital for international market success. Specifically, increasing attention has been paid to open innovation (OI), which refers to the “use of both inflows and outflows of knowledge to improve internal innovation and expand the markets for external exploitation of innovation” (Cheng and Huizingh, 2014, p. 1235). OI is also defined as “distributed innovation process based on purposely managed knowledge flows across organizational boundaries, using pecuniary and non-pecuniary mechanisms in line with the organization’s business model” (Chesbrough and Bogers, 2014, p. 1). By embracing OI with various stakeholders, SMEs can gain various benefits – including risk reduction, timely entry into international markets and innovation performance (Albats *et al.*, 2020; Nordman and Tolstoy, 2016). While assuming that OI is beneficial to the international efforts of large firms (Naqshbandi and Jasimuddin, 2018), only scant prior research has hitherto examined the OI and international competitiveness of ESMEs (cf. De Silva and Wright, 2019; Martínez-Román *et al.*, 2019). Furthermore, the OI strategies adopted by firms differ considerably, as some engage in it domestically, whereas others do so internationally (Leckel *et al.*, 2020). Domestic and international OI strategies exert differing influences on the types of external knowledge and outcomes in relation to value creation (Kafouros and Forsans, 2012). The OI literature has rarely differentiated between the domestic and international search for knowledge. Specifically, most scholarly attention has been devoted to the significance of domestic OI for SME international competitiveness (Santoro *et al.*, 2019), neglecting international open innovation (IOI), which is nevertheless an important research area, particularly in the context of resource-constrained ESMEs that are rapidly internationalizing.

Our study was, therefore, focused on the nexus between IOI and international market success. This can be considered important for ESMEs for two reasons. First, ESMEs have fewer competitive resources and capabilities in terms of technology, international marketing competencies and financial resources, which hinders their success in both the domestic and foreign markets; therefore, they need to be open to the establishment of network partnerships with international counterparts not only to innovate (Bhatti *et al.*, 2021; Soto-Acosta *et al.*, 2018),

---

but also to achieve international competitiveness (Scuotto *et al.*, 2020b). Second, the lack of commercial assets and the weak institutional context found in emerging markets (EMs) encourage ESMEs to explore IOI to achieve international market gains (Radulovich *et al.*, 2018). Accordingly, by drawing insights from the extended resource-based view (extended RBV), our study considered the importance of IOI for the international market success of ESMEs. Furthermore, we argued for the existence of boundary conditions for the relationship between IOI and international market success. Specifically, we zoomed in on two key moderators – cross-cultural competencies and digital alliance capabilities. First, we considered the moderating role of cross-cultural competencies. Given that IOI is a complex and costly process – which requires close coordination between knowledge exchange partners – cross-cultural competencies is likely to reduce any ambiguity found in the knowledge-exchange process (Basuil and Datta, 2015). Second, digital alliance capabilities facilitate the communication and coordination of OI activities through information and communication technologies (ICTs) (Urbinati *et al.*, 2020), which include “electronic communication tools (e.g. email, instant messaging, voice mail, faxing, and paging), electronic conferencing tools (e.g. data conferencing, voice conferencing, videoconferencing, discussion forums, and chat systems), collaborative work management tools (e.g. file sharing and group calendars), and social networking tools (e.g. Facebook, Yammer, and Chatter)” (Oldham and Silva, 2015, p. 7). By exploiting their digital alliance capabilities, ESMEs can influence the level of joint dependency, remain connected with their international partners and transform the structure of their international relationships (Cherbib *et al.*, 2021). In fact, digital alliance capabilities enable partners to connect easily with each other, learn more and achieve their mutual objectives (He *et al.*, 2020). Such capabilities can further support the co-creation of opportunities for innovation and ESME international market success. Therefore, it is important to understand the role played by digital alliance capabilities in facilitating IOI and the international market success of ESMEs.

Thus, our study was aimed at answering the following two interrelated questions: “What is the relationship between IOI and the international market success of ESMEs?” and “What are the impacts of cross-cultural competencies and digital alliance capabilities on the relationship between IOI and the international market success of ESMEs?” To answer these questions, we leveraged a unique primary survey involving 231 ESMEs originating from the UAE, which has been referred to as a very good and rather underexplored context for such type of research (e.g. Elbanna and Fadol, 2016; Genc *et al.*, 2019).

Our study makes three important contributions to the extant literature. First, it extends the international marketing and OI literature by suggesting that IOI provides ESMEs with resources and competencies suited to the development of innovative products that meet their global customers’ needs; this, in turn, will enhance their international market success. Diverging from most prior studies, which emphasized domestic OI for innovation and financial performance (Leckel *et al.*, 2020; Popa *et al.*, 2017), this finding provides empirical evidence that IOI impacts the international market success of ESMEs. Second, the literature on international marketing suggests that international alliances entail risks in terms of the competencies required to effectively manage them and utilize the resources embedded in alliance networks (Kamalaldin *et al.*, 2020; Kohtamäki *et al.*, 2018). Thus, this study integrated two important moderating factors leading to international market success – cross-cultural competencies and digital alliance capabilities – as critical aspects of knowledge capabilities in this context. Third, our study adds to the limited literature on the international market success of ESMEs. Particularly, we drew our data from the UAE, which, due to its numerous smaller private firms, is among the most relevant contexts for this kind of research (e.g. Genc *et al.*, 2019). As private ESMEs are at a disadvantage compared to their state-owned counterparts in regard to accessing valuable resources at home and achieving institutional support (Nakos *et al.*, 2019; Pervan *et al.*, 2015), leveraging IOI might be an important

---

alternative for them to overcome their home market resource constraints and achieve international market success.

Besides contributing to knowledge, our study has practical and policy implications. First, it provides ESME managers with a new approach to innovation by highlighting the importance of international alliances and networks. Specifically, ESMEs can engage in IOI to overcome any issues linked to limited resource availability and lack of institutional support found in their domestic markets. By engaging in IOI, ESMEs can gain new knowledge and promote learning conducive to international market success. Second, our study demonstrates that ESMEs need to acknowledge and consider digital alliance capabilities to virtually coordinate and communicate their IOI activities with their network partners. ESMEs should invest in the development of those digital alliance capabilities that can influence the quality of their IOI and, in turn, determine their international market success. Third, our study highlights the relevance of cross-cultural competencies in ensuring that managers perform IOI activities effectively to promote international market success. Thus, ESMEs need to offer their managers cross-cultural training and simulations to promote their cultural learning opportunities. Our findings also provide important insights to EM policy makers, who – as they are keen to develop their economies and promote the internationalization of small firms – need to provide institutional support and facilitate the exposure of such firms to international networks (e.g. through their participation in trade fairs), to enable them to leverage those networks for knowledge and develop their capabilities. Policy makers could also provide special incentives – such as vouchers for innovation – to those small firms that are rapidly expanding into foreign markets and utilizing international sources of knowledge. Finally, policy makers could also support small firms by identifying and connecting them to any relevant international sources of knowledge and innovation.

## **2. Theoretical background and hypotheses development**

### *2.1 International open innovation and the extended resource-based view*

Over the decades, the RBV has been one of the dominant frameworks emphasizing a firm's internal resources as the primary means for the development of competitive advantage (Barney, 1991). Amit and Schoemaker (1993) described such resources as the “stocks of available factors that are owned and controlled by the firm” (p. 35). The conventional RBV has been criticized because of its under-emphasis of the role played in shaping competitive advantage by the external resources entrenched in strategic alliances (Arya and Zhiang, 2007; Mahoney, 2001). Against this backdrop, a growing research stream is extending the RBV (Dyer and Singh, 1998; Lavie, 2006), whereby the complementary resources attained through external partners are also sources of a firm's competitive advantage (Gulati, 2007). This extended RBV suggests that external alliance resources provide strategic opportunities for the acquisition of a partner's knowledge resources – which, in turn, are conducive to the development of competitive positioning (Paul and Rosado-Serrano, 2019). Thus, building on the logic of the extended RBV (Arya and Zhiang, 2007; Lavie, 2006), our study highlights external network resources as a source of competitive advantage for firms.

International marketing research suggests that, compared with large multinationals, internationalizing ESMEs possess limited financial and knowledge resources suited to act as sources of competitive advantage (Khan and Lew, 2018; Puthusserry *et al.*, 2020). Furthermore, ESMEs are often private firms and experience latecomer difficulties – i.e. they lack the competitive and managerial resources and capabilities (Wang *et al.*, 2014; Xiao *et al.*, 2021) that are vital to attain a competitive positioning in the international marketplace. Hence, ESMEs need to set up strategic alliances with international partners and engage in costly innovation activities to overcome their home market disadvantages, such as their lack of resources and capabilities (Del Giudice *et al.*, 2019; Sandberg, 2014).

---

This is consistent with the extended RBV, which suggests that, to a great extent, the nature and type of any external alliances determine and signify their value and uniqueness (Ireland *et al.*, 2002; Rauch *et al.*, 2016), meaning that not all strategic alliances have the same implications for international market success (Abdelbadie and Salama, 2019; Xiao *et al.*, 2021). Accordingly, by drawing on the extended RBV, our study provides an explanation for the ways in which these firms remedy their resource and capability voids by relying on international strategic alliances. In this regard, we argued that IOI constitutes a differentiating factor in regard to the degree of international market success achieved by ESMEs. Generally, IOI is a model that describes the ways in which firms innovate by soliciting ideas from or sharing internal resources with international alliance partners (Chesbrough, 2006; Chesbrough *et al.*, 2018). As such, it involves two prominent categories: inbound and outbound innovation. Inbound innovation refers to the inflow of knowledge and inputs from external partners aimed at facilitating innovation (Jasimuddin and Naqshbandi, 2019), whereas outbound innovation relates to leveraging of internal resources and knowledge to external partners by licensing and forming alliances suited to generate value (Bellantuono *et al.*, 2013). A large body of IOI research has focused on large multinational firms, which possess the resources and capabilities necessary to benefit from external networks (Li and Kozhikode, 2009; Mortara and Minshall, 2011; Naqshbandi and Jasimuddin, 2018). Lately, growing scholarly attention has been devoted to domestic OI in the context of SMEs (Martinez-Conesa *et al.*, 2017; Popa *et al.*, 2017). For example, Freixanet *et al.* (2020) recently examined the influence of international entrepreneurial orientation as a key antecedent of OI and of social media as a mediator between OI and innovation performance. Furthermore, Hameed *et al.* (2021) suggested that external knowledge and internal innovation influence OI performance in a domestic context (Pakistan). Although research has emphasized on IOI (Brem and Nylund, 2021), to date, how engaging in it benefits the international market success of ESMEs remains unclear. We posited that IOI supports ESMEs in overcoming any home market constraints and in adapting to globally competitive environments. Thus, IOI promotes new technological and organizational knowledge (Romero-Martínez *et al.*, 2017; Santoro *et al.*, 2018), while also increasing ESME international market success (Musteen *et al.*, 2014).

The scholarship suggests that engaging in IOI results in complexities relating to the need to adapt to cultural differences, which may limit the value-generating potential of external relationships (Elia *et al.*, 2019; Ojala, 2009; Peeters *et al.*, 2015). Furthermore, any cultural differences between alliance partners affect the ways they interact, exchange knowledge and learn from each other (López-Duarte *et al.*, 2016). Unlike domestic partnerships, international alliances face problems of “double layered acculturation” (Barkema *et al.*, 1996, p. 154), which may “inhibit the informal chemistry that is essential for coordination and ongoing conflict resolution in alliances” (Lavie and Miller, 2008, p. 626). Accordingly, Kujala and Törnroos (2018) suggested that ESMEs should pay attention to the influence of IOI strategies and consider maintaining and developing relationships in ways that are mutually beneficial. Thus, our study attempted to examine how an ESME’s cross-cultural competencies and digital alliance capabilities affect the relationship between IOI and international market success. We suggested that those ESMEs that engage in IOI will perform better in achieving international market success if they possess the cross-cultural competencies and digital alliance capabilities needed to build and maintain successful external partnerships for value creation. These arguments are consistent with those found in the extant literature, which recommends that OI involves a diverse and wide range of distributed network collaborators, also in terms of ecosystems and platforms (West, 2014). Against this backdrop, digital technologies – such as open-source software and virtual innovation competition – play a vital role in facilitating such collaborations (Ebner *et al.*, 2009); thus, cross-cultural competencies and

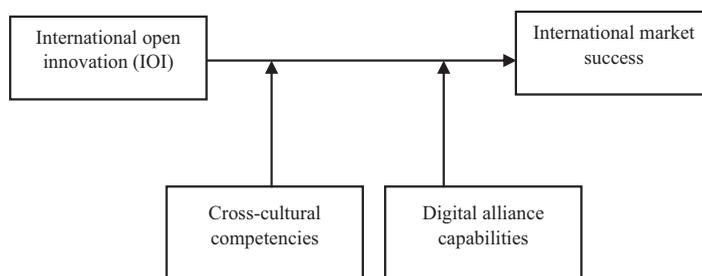

digital alliance capabilities take central stage in regard to enhancing value through IOI for ESMEs.

The following sections examine the role played by IOI for ESME international market success. Furthermore, we provide arguments related to the moderating role played by cross-cultural competencies and digital alliance capabilities in the IOI–international market success relationship. [Figure 1](#) shows the conceptual model and hypotheses of this study.

## 2.2 International open innovation and international market success

In general, OI is beneficial for firm performance ([Carayannis and Grigoroudis, 2014](#); [Singh et al., 2019](#)). For example, [Popa et al. \(2017\)](#) suggested that OI effectiveness can lower costs, increase sales and enhance technological positions. In this case, SMEs had become involved in OI with domestic partners to the end of sharing benefits. However, increased globalization and dynamic environments call for the diversification of sources of knowledge and the sharing of ideas with international alliance partners ([Xiao et al., 2021](#)). OI differs for SMEs and large firms mainly due to the different contributions it makes to their competitiveness ([Lee et al., 2010](#)). To understand the influence of OI on SMEs, we considered the context of the UAE, which has been quite successful in establishing a strong presence in the business industry and implementing major reforms ([UAE, 2013](#)). The knowledge capacity of the UAE has grown substantially by relying on foreign partners and government support for innovation ([Pervan et al., 2015](#)). There have been mass projects – such as Dubai Media City, Internet City, etc. – in which SME firms were able to collaborate and interact with one another for OI. Moreover, scholars argue that SMEs can enhance their performance through OI by expanding beyond their institutional boundaries ([Pervan et al., 2015](#)). However, local sources of knowledge may not be sufficient to support SMEs in exploiting international opportunities, given that the valuable knowledge required resides across distributed global networks. Therefore, IOI plays an important role in enabling firms to develop a competitive advantage ([Guo and Zheng, 2019](#)), including international market success.

First, prior empirical research suggests that knowledge creation and diffusion are localized and spatially bound ([Almeida and Kogut, 1999](#)). This geographical constraint can limit an ESME's ability to benefit from any externalities arising from knowledge in different international markets ([Kafouros and Forsans, 2012](#)). IOI may assist ESMEs in accessing a variety of knowledge generated in different marketplaces, thereby boosting innovation and facilitating international market success ([Musteen et al., 2014](#)). This is particularly true in the context of EMs, such as the UAE, which lack in-house sophisticated knowledge and technologies. Scholarship suggests that EM firms benefit from international networks in developing innovations (cf. [Khan et al., 2018](#)). IOI also enables ESMEs to achieve international market success by exploiting their existing knowledge and technologies in the global marketplace, yet minimizing the risks linked to obsolescence to remain competitive ([Singh et al., 2019](#)).

**Figure 1.**  
The conceptual  
framework of  
our study

---

Second, IOI brings together partners from diverse geographic locations onto the same innovation platform (e.g. West, 2014); thus, these partners are able to realize and appreciate each other's concerns and to work together for mutual solutions (Kujala and Törnroos, 2018). The collective innovation efforts made by international alliance partners help them develop a common understanding of critical interdependencies where innovation is desired (Wang and Hu, 2020). Accordingly, IOI boosts the power and efficiency of jointly produced knowledge and innovations, besides accommodating dynamic market interests, thereby enabling the satisfaction of international market demands (Puthusserry *et al.*, 2020). In synthesis, we formulated the following hypothesis:

*H1.* IOI is positively related to ESME international market success.

### *2.3 The moderating role of cross-cultural competencies*

The extended RBV posits that the market success of international alliances is often a function of the implementation of effective knowledge-sharing routines aimed at transferring or creating specialized knowledge (Dyer and Singh, 1998; Dyer *et al.*, 2018). This is particularly true in regard to the execution of complex tasks, such as those associated with IOI. In the context of international alliances, the transfer of knowledge for complex and novel IOI activities may be hindered by cultural differences (Narooz and Child, 2017), which may present significant challenges to nurturing IOI (Jain *et al.*, 2019; Oehme and Bort, 2015).

We argued that the expected positive relationship between IOI and international market success will be contingent on ESMEs having cross-cultural competencies, which refer to their management's possession of the set of skills, knowledge and traits required to work with people across different national cultures (Johnson *et al.*, 2006). Those ESME managers who are equipped with cross-cultural competencies often possess cultural knowledge, cross-cultural sensitivity and communication abilities (Ferrerias-Méndez *et al.*, 2019), as well as the skills needed to adjust between cultural frames and apply cultural competencies during IOI activities (Liu *et al.*, 2015). If equipped with an adequate pool of cross-cultural knowledge, managers can overcome any anxiety felt in relation to how individuals from different cultures will work and interact with each other (Nadeem *et al.*, 2018). High levels of familiarity with different cultures can enhance the effectiveness of international alliances and information exchanges (Presbitero, 2020). In addition, behavioral flexibility can enable ESME managers to readily adjust and adapt to the needs of any given cultural context (Presbitero, 2021). Thus, we argued that, when ESMEs become involved in international activities and are able to conduct themselves appropriately in cross-cultural contexts, their IOI can be enhanced, thereby promoting their international market success. Specifically, high levels of cross-cultural competencies enable ESME managers to recognize cultural differences and react accordingly, thus giving positive impressions in IOI contexts to achieve international market success (Schneider and Engelen, 2015). Under conditions of low cross-cultural competencies, ESMEs may realize imperfect IOI gains, which can ultimately fail to meet international market demands. Thus, the interaction between higher cross-cultural competencies and IOI enables ESME managers to effectively transfer the knowledge and develop the innovation that may bring about international market success (Scuotto *et al.*, 2020a). This is consistent with the extended RBV, which posits that ESMEs need knowledge-sharing routines (i.e. cross-cultural competencies) as a regular pattern of interaction in IOI activities, thus enabling the creation, sharing and recombination of knowledge for innovation, and leading to international market success (Dyer *et al.*, 2018; Lavie, 2006).

Hence, this study contends that the greater the cross-cultural competencies possessed by managers, the greater the international market success that ESMEs can achieve through their engagement with IOI. By contrast, when an ESME's cross-cultural competencies are

limited or poor, it accrues fewer benefits from its IOI for international market success. The above arguments led us to formulate the following hypothesis:

- H2.* Cross-cultural competencies moderate the effect of IOI on ESME international market success; the positive influence of IOI on international market success is increased by the presence of cross-cultural competencies.

#### *2.4 The moderating role of digital alliance capabilities*

Digital alliance capabilities relate to the exploitation of various ICTs “to purposefully create, extend, or modify the firm’s resource base, augmented to include its alliance partners’ resources” (Helfat *et al.*, 2007, p. 66). According to the extended RBV, digital alliance capabilities comprise governance mechanisms that helps ESMEs to virtually monitor and manage IOI with their exchange partners (Dyer *et al.*, 2018). Considering the momentum of the internet of things (IoTs), platforms and digital ecosystems – which are changing the nature of IOI (cf. West, 2014) – ESMEs can benefit from the international exchange of knowledge by building their digital alliance capabilities (Bereznoy *et al.*, 2021; Santoro *et al.*, 2018). Accordingly, this study draws from this logic to examine the potential moderating role played by digital alliance capabilities on the hypothesized relationship between IOI and international market success of ESMEs.

Given the smaller number of competitive resources they possess in comparison to large multinationals, ESMEs need to rely on IOI strategies to achieve international market success (Xiao *et al.*, 2021). However, engaging with IOI and generating value through it can be challenging due to various relational ties, the differing needs of exchange partners, and not-invented-here attitudes and syndrome (e.g. Antons and Piller, 2015; Katz and Allen, 1982). Viewed as effective governance mechanisms, digital alliance capabilities promote the electronic processing of information and exchange of vital data to coordinate OI activities with dispersed international partners. Digital alliance capabilities are, thus, expected to enhance IOI effectiveness for international market success by reducing transaction costs and improving the internalization of any key knowledge originating from international network partners. Higher levels of digital alliance capabilities in information technology (IT)-enabled IOI activities can serve as a tool for relational contracts, reducing transactional costs and creating governance value through self-enforcing agreements (Kim *et al.*, 2018). In addition, digital alliance capabilities, as a relationship-specific investment, favor the communication of critical information and enhance the mutual commitment of international partners toward OI (Bresciani *et al.*, 2018), which ultimately enhances ESME international market success (Santoro *et al.*, 2019). Therefore, this study drew insights from the extended RBV (Dyer and Singh, 1998) to argue that when ESMEs possess higher digital alliance capabilities, the benefits of IOI for international market success increase. The preceding discussion led us to posit the following hypothesis:

- H3.* Digital alliance capabilities moderate the effect of IOI on ESME international market success, i.e. the positive influence of IOI on international market success increases in the presence of high digital alliance capabilities.

### **3. Research method**

#### *3.1 Sample and data collection*

The hypotheses of this study were tested on a sample of SMEs operating in the UAE. This context is particularly important for two reasons. First, the UAE is a fairly new EM in the Middle East with a rapidly evolving economy. The country has transformed itself from an underprivileged nation to a regional business hub and a top tourist destination (UAE, 2020).

---

In recent years, the UAE has developed non-oil sectors to reduce its dependency on oil. This has led to the emergence of a large number of small firms in the manufacturing and service sectors. Second, SMEs based in the UAE are better positioned than others operating in similar markets. Their key advantages are because of local export and re-export facilities, with airports and ports linking 85 airlines and 120 shipping lines to over 130 destinations (Pervan *et al.*, 2015). With this economic outlook, it has become imperative to study the IOI and international market success of ESMEs located in the UAE (which have been relatively under-researched) as it continues to diversify its economy (Nakos *et al.*, 2019).

The study's sampling frame was drawn from the Commercial Directory of the Dubai Chamber of Commerce and Industry (DCCI, 2018–19). The selection criteria for our sample ESMEs were as follows: (1) being private and independent entities, not part of any bigger business group; (2) having less than 250 employees; (3) being engaged in international activities at least in the past three years; and (4) possessing international alliance experience for innovation activities. Following these selection criteria, 378 firms were identified to be included in our study. We conducted a survey with top managers (e.g. owners, chief executive officers (CEOs) and senior managers) from these ESMEs. To ensure the survey questionnaire's content and face validity, we conducted in-depth pilot interviews with four senior managers, during which they commented on the relevance and completeness of the questionnaire items. Based on their feedback, we revised the items to enhance the clarity and designed the final version of the questionnaire, which was administered in English, as the most common first or second language of most organizations in the UAE (Al Ariss and Guo, 2016).

The survey, which was conducted between February and June 2019, was distributed by means of a drop-off and collection technique (Aljifri and Khasharmeh, 2006; Elbanna and Fadol, 2016). In recent years, this data collection technique has gained popularity within EM contexts (Boso *et al.*, 2019; Nakos *et al.*, 2019), due to the declining response rates observed in mail and online surveys. The questionnaire was distributed to firms located in Dubai's Jebel Ali Free Zone, as this is one of the world's biggest free trade zones (Jafza, 2020). Ultimately, a total of 231 completed questionnaires were returned, providing a response rate of 61.11%. The sample characteristics are summarized in Table 1.

### 3.2 Measures

The study constructs were assessed using multiple-item measures adopted from previous literature. We measured all items on a seven-point Likert scale. The details of the measures, reliability and validity assessments are provided in Table 2.

**3.2.1 International open innovation.** We defined IOI as the soliciting of ideas from and the sharing of internal intellectual property with international alliance partners (Chesbrough, 2006). Following previous studies (Cheng and Huizingh, 2014; Martinez-Conesa *et al.*, 2017), we conceptualized IOI with two dimensions: inbound and outbound innovation. We measured inbound innovation with four items, and outbound innovation with three. Although we had adopted the items from previous studies (Cheng Colin and Shiu Eric, 2015; Popa *et al.*, 2017), we had changed their wording reflect the international innovation context. A composite of the two dimensions constituted the variable score for IOI.

**3.2.2 Cross-cultural competencies.** Cross-cultural competencies are individual abilities to function effectively with people from different cultures (Johnson *et al.*, 2006). We adapted and modified five items from Wang *et al.* (2014) to assess cultural adaptability in international alliances.

**3.2.3 Digital alliance capabilities.** Digital alliance capabilities refer to the abilities of ESMEs to manage international alliances using a wide range of ICTs (Nambisan *et al.*, 2017; Urbinati *et al.*, 2020). Digital alliance capabilities were measured along the three dimensions of

IMR

	Frequency (s)	Percentage (%)

**Table 1.**  
Demographic  
information

alliance bonding, alliance coordination and alliance communications. Alliance bonding entails the ability to develop strong bonds with alliance partners by assigning them instrumental value through the use of ICT (Schreiner *et al.*, 2009). Alliance coordination relates to an ESME's ability to align alliance tasks and arrange joint value mechanisms among alliance partners using ICT (Kandemir *et al.*, 2006). Alliance communication refers to the sharing of meaningful and timely information using ICT between alliance partners. All three dimensions were measured using multi-items taken from past studies (Bresciani *et al.*, 2018; Santoro *et al.*, 2018; Schreiner *et al.*, 2009; Shin, 2010).

*3.2.4 International market success.* International market success was measured over the previous three years by using five items (Musteen *et al.*, 2010). These items assessed firm-level international market success relative to major competitors over the past three years [1] in terms of attainment of profitability goals, sales growth, market share growth, the introduction of new products and contribution of new products to overall profits (Millson, 2015; Zhong *et al.*, 2013).

*3.2.5 Control variables.* We included several control variables such as size, age, type of industry and research and development (R&D) intensity. Firm size was assessed through the

Item description	Standardized factor loadings
Contribution of new products to profits	0.75
<i>Fit statistics</i>	
$\chi^2/\text{df}$	1.13
CFI	0.99
NFI	0.94
RMSEA	0.02
SRMR	0.04

**Table 2.** Note(s): \*Deleted due to poor factor loading

natural logarithm of the number of employees. Firm age was measured by the number of years since a firm had been founded. To control for industry, we included a dummy variable that discriminated between manufacturing and services. R&D intensity was assessed as the ratio of R&D employees to full-time employees.

#### 4. Data analysis and results

##### 4.1 Potential bias testing

To test for non-response bias, we compared the early and late respondent groups in terms of firm characteristics, such as firm size and firm age. The comparison of the two groups showed no significant differences ( $p > 0.05$ ), thus suggesting that non-response bias had had no influence on our study results (Armstrong and Overton, 1977).

Furthermore, concerns about common method bias (CMB) could have arisen given the reliance on self-reported data from a single respondent for both the dependent and independent variables. Accordingly, we followed the statistical procedures suggested by prior research to determine whether CMB was present in our data (Chang *et al.*, 2010; Podsakoff, 2003). Specifically, we performed a confirmatory factor analysis (CFA) in AMOS 26.0 and estimated three competing CFA models (Boso *et al.*, 2013). Model 1 estimated a method-only model in which all the items were loaded on a single latent construct:  $\chi^2/\text{df} = 9.37$ ; CFI = 0.43; NFI = 0.41; RMSEA = 0.19; SRMR = 0.16. Model 2 was a trait-only model in which each item was loaded on its respective latent construct:  $\chi^2/\text{df} = 1.13$ ; CFI = 0.99; NFI = 0.94; RMSEA = 0.02; SRMR = 0.04. Finally, Model 3 was a method-and-trait model that involved the joint estimation of Models 1 and 2:  $\chi^2/\text{df} = 1.12$ ; CFI = 0.99; NFI = 0.95; RMSEA = 0.02; SRMR = 0.04. A comparison of the three models indicated that Models 2 and 3 were superior to Model 1, and that Model 3 was not substantially better than Model 2. Hence, this suggested that CMB was not a serious concern in our study.

Finally, to reduce the potential error with respect to retrospective data, we followed previous studies (e.g. Ju and Gao, 2017; Murray *et al.*, 2011) and asked our respondents to concentrate on one major international market that was being served by their firm in responding to our survey. However, given the retrospective nature of the study, the existence of recall and current-attitude biases cannot be completely ruled out (Heidenreich *et al.*, 2015).

##### 4.2 Reliability and validity of the measurement model

To assess the reliability and validity of our multiple-item measures, we performed CFA using the maximum likelihood (ML) estimation method in AMOS 27.0. In line with previous recommendations (Bagozzi and Yi, 2012; Kline, 2015), we relied on the chi-square ( $\chi^2$ ) test and a number of heuristic fit indices to assess model fit. According to the psychometric literature, the normed chi-square should be ideally  $< 2.00$ , CFI  $\geq 0.90$ , NFI  $\geq 0.90$ , RMSEA  $\leq 0.07$  and

---

SRMR  $\leq 0.07$  (Bagozzi and Yi, 2012). The results of the CFA model provided adequate fit for the data:  $\chi^2/df = 1.13$ ; CFI = 0.99; NFI = 0.94; RMSEA = 0.02; SRMR = 0.04. As Table 2 shows, the factor loadings for each item were found to be positive and significant at 1%, thus supporting the convergent validity of our measures.

Reliability was established by assessing Cronbach's alpha, composite reliability and average variance extracted (AVE) (Table 2). Cronbach's alpha and composite reliability values exceeded the respective recommended thresholds of 0.70 and 0.60, respectively (Hair *et al.*, 2017), thus confirming the reliability of our constructs. Furthermore, the AVE values for each construct exceeded the required benchmark of 0.50, hence suggesting adequate construct convergent validity (Fornell and Larcker, 1981). We assessed discriminant validity by performing Fornell and Larcker's (1981) test to determine whether the square of the AVE for each construct exceeded the correlation of each pair of constructs. As displayed in Table 3, the square of the AVE for each construct was found to be greater than the inter-construct correlations; thus, we confirmed the discriminant validity of our study constructs.

#### 4.3 Hypotheses testing

We performed a hierarchical regression analysis to examine the relationship between IOI and international market success, as well as the moderating effects of cross-cultural competencies and digital alliance capabilities. Hierarchical regression analysis is a technique that is appropriate not only to examine contextual-based models (Cohen *et al.*, 2003), but also to evaluate the statistical differences in the total variance explained due to the next higher-order interactions (Wiklund and Shepherd, 2005). We mean-centered all the variables that were involved in interaction analysis. This exercise helped to reduce the occurrence of multicollinearity in our results. We calculated the variance inflation factors (VIF) to account for multicollinearity. The highest VIF value, which was found to be 1.90, was well below the recommended threshold of 10 (Aiken *et al.*, 1991), thus indicating that multicollinearity was not an issue in our analysis. Table 4 provides the detailed results of our analysis. Model 1 is a baseline model aimed at estimating the effect of our control variables on international market success.

H1 proposed that IOI is positively related to international market success. As shown in Model 2 of Table 4, a positive and significant relationship was found between IOI and international market success ( $\beta = 0.25$ ;  $p < 0.001$ ), providing support for H1. H2 predicted that cross-cultural competencies strengthen the relationship between IOI and international market success so that the relationship will be stronger for ESMEs with high cross-cultural competencies. Model 4 in Table 4 shows the interaction term between IOI and cross-cultural competencies (i.e. IOI  $\times$  CCC) to be positive and significant ( $\beta = 0.24$ ;  $p < 0.01$ ). Thus, H2 was found to be supported. H3 argued that international market success is maximized in the presence of high levels of both IOI and digital alliance capabilities. As shown in Model 6 of Table 4, the interaction terms involving IOI and digital alliance capabilities (i.e. IOI  $\times$  DAC) were found to be positive and significant ( $\beta = 0.16$ ;  $p < 0.05$ ). In supporting H3, the results suggest that an alignment of high levels of IOI and digital alliance capabilities is associated with greater ESME international market success.

#### 4.4 Post hoc analysis

To check the robustness of our findings, we conducted two additional analyses. First, we re-estimated our hypotheses using structural equation modeling (SEM) in AMOS 27.0. The results provided support for the relationship between IOI and international market success ( $\beta = 0.26$ ;  $p < 0.001$ ) and for the moderating effects of cross-cultural competencies ( $\beta = 0.22$ ;  $p < 0.01$ ) and digital alliance capabilities ( $\beta = 0.14$ ;  $p < 0.05$ ). Furthermore, the fit

Results of regression  
analyses

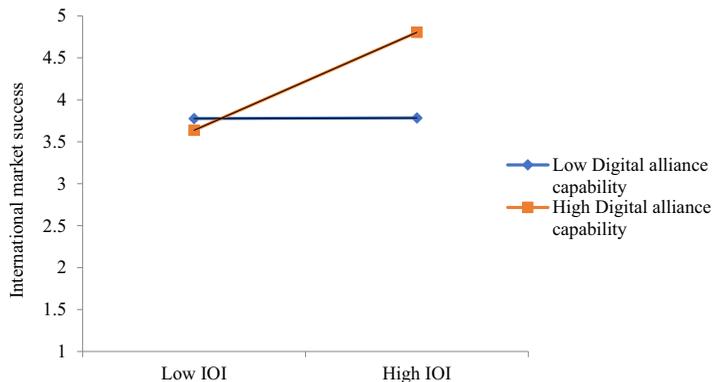

indices for the structural model suggested good fit:  $\chi^2/DF = 1.20$ ; CFI = 0.99; NFI = 0.96; RMSEA = 0.04; SRMR = 0.03.

Second, we estimated the hypothesized moderating mechanisms using the PROCESS macro (Hayes, 2017). Specifically, the study utilized Model 1 of the PROCESS macro with a 95% bias-correction confidence interval. The results suggested a significant main effect of IOI on international market success ( $\beta = 0.29$ ;  $p < 0.001$ ) moderated by cross-cultural competencies ( $\beta = 0.38$ ;  $p < 0.001$ ) so that the effect of IOI on international market success is stronger when ESMEs have a higher cross-cultural competency (effect = 0.36;  $p < 0.001$ ; LLCI = 0.15 - ULCI = 0.57), thereby supporting H2. Further, the results showed a significant moderating effect of digital alliance capabilities ( $\beta = 0.16$ ;  $p < 0.05$ ) for the IOI–international market success relationship. Under conditions of high digital alliance capabilities, the effect of IOI on international market success was found to be positive and significant (effect = 0.46;  $p < 0.001$ ; LLCI = 0.23; ULCI = 0.68). Thus, we concluded that H3 was supported. To interpret the significance of the moderation effects, we followed previous practices (Aiken *et al.*, 1991; Cohen *et al.*, 2013) and plotted: (1) the moderating effect of cross-cultural competencies on IOI and international market success relationship and (2) the moderating effect of digital alliance capabilities on IOI and international market success relationship. The results are graphically presented in Figures 2 and 3.

**Figure 3.** Moderating effect of digital alliance capabilities on IOI and ESME international market success

---

## 5. Discussion and implications

We sought to understand whether IOI has a positive impact on international market success and whether cross-cultural competencies and digital alliance capabilities moderate the baseline hypothesis. Specifically, we drew arguments from the extended RBV (Dyer and Singh, 1998) and international market literature and argued that ESMEs achieve international market success from IOI when they have high cross-cultural competencies. In addition, this paper contends that IOI leads to ESME international market success in the presence of strong digital alliance capabilities. Our results show that IOI has a positive relationship with international market success of ESMEs. While previous studies have extensively examined the implications of domestic OI for competitiveness (Leckel *et al.*, 2020; Singh *et al.*, 2019) and international market success (Santoro *et al.*, 2019), ESMEs focusing on domestic OI may not have access to advanced and fine-grained knowledge, which is locally unavailable, thereby leading to limited knowledge base and resulting in a lack of novelty (Kapetaniou and Lee, 2019). As such, our findings confirm that IOI is indeed vital to access advanced knowledge and technology that are conducive to international market success of ESMEs. This is consistent with Brem and Nylund's (2021) argument, suggesting that IOI develops innovation in line with local culture and overcomes operating barriers, thereby leading to international market success. Also, this finding is in line with the extended RBV, which suggests that ESMEs' access to complementary partner resources is vital to gain competitive advantage in the dynamic marketplaces (Dyer *et al.*, 2018). Given that ESMEs lack resources and market knowledge, IOI offers them a vital channel to develop their capabilities and enhance their international market success.

We also found that cross-cultural competencies moderate the impact of IOI on international market success of ESMEs. Specifically, the results suggest that, under conditions of high level of cross-cultural competencies, the effect of IOI on international market success is stronger. Previous studies indicate that different countries exhibit different characteristics and political environment, which require cross-cultural sensitivity and management (Cooke *et al.*, 2018; Stoermer *et al.*, 2021). To extend this line of research, our study confirms that in the presence of high level of cross-cultural competencies, ESMEs can exploit IOI to achieve high level of international market success.

Our results further indicate that digital alliance capabilities of ESMEs moderate the impact of IOI on their international market success. In the current context of the digital transformation, digitization has lowered the barriers into innovation activities for an unprecedented number of innovators worldwide (Bogers *et al.*, 2017). In addition, scholars suggest that a wide range of digital systems can manage – or help to manage – their interaction with diverse alliance partners (He *et al.*, 2020; Pagani and Pardo, 2017). Adding to this line of research, our findings confirm that digital alliance capability is a vital contingency factor to promote the impact of IOI on ESMEs' international market success. This finding is consistent with the extended RBV that suggests that effective governance of alliance using digital alliance capabilities is vital to utilize IOI for international market success (Dyer and Singh, 1998).

### 5.1 Theoretical implications

Our study contributes to the international marketing and innovation management literature in several ways. First, its findings differ from those of prior studies that were mainly focused on OI in domestic contexts. For example, recent research has found that external knowledge and internal innovation influence OI performance in domestic contexts (Hameed *et al.*, 2021). Our study focused on OI in an international context, considering the role played by key skills (digital alliance capabilities and cross-cultural competencies), which had been ignored in former studies. Also, Cheah and Ho (2021) only considered the role played by outbound innovation in influencing commercialization performance. By leveraging both inbound and

---

outbound forms of innovation, our study extends the theoretical boundaries of OI research and provides a new understanding of how firms can integrate their outbound and inbound innovation practices while maintaining their cross-cultural competencies and digital alliance capabilities.

Second, while previous research has indicated that international strategic alliances drive international market success (Kujala and Törnroos, 2018; Puthusserry *et al.*, 2020), the theoretical specification and empirical examination of how IOI drives ESMEs international market success remain rather underexplored (Bhatti *et al.*, 2021). We argued that IOI provides access to knowledge and innovation that ESMEs can exploit to achieve international market success. Our findings show that IOI has a material effect on international market success. In the context of UAE-based ESMEs, access to necessary resources is limited in the domestic market due to the limited institutional support for SMEs and the presence of increasing numbers of large multinationals (Nakos *et al.*, 2019). Thus, ESMEs endowed with IOI are more likely to grow and succeed by achieving international market success while expanding in international markets.

Third, drawing insights from the extended RBV (Dyer and Singh, 1998), we argued that, although IOI may enable ESMEs to achieve international market success, such a relationship may be more or less influential depending on their possession of certain underpinning competencies and capabilities. Specifically, the results suggest that the effectiveness of IOI in promoting international market success is conditional on ESME cross-cultural competencies and digital alliance capabilities. The above-reported results show that IOI significantly and positively affects ESME international market success in the presence of greater cross-cultural competencies and digital alliance capabilities. This finding is particularly important in an EM context like that of the UAE, in which cross-cultural competencies and digital alliance capabilities help ESMEs to develop competitive advantages, which then aid the exploitation of IOI for international market success.

Finally, our empirical findings make an important contribution to OI literature focusing on ESMEs (Bhatti *et al.*, 2021; Pervan *et al.*, 2015). Moving beyond the domestic OI (Leckel *et al.*, 2020), our study suggests that IOI enables global knowledge sourcing and a varied set of knowledge elements that are conducive to ESMEs' international market success (Kapetaniou and Lee, 2019). However, it is difficult for ESMEs to coordinate their innovation efforts with international partners (Xiao *et al.*, 2021). In this regard, our study found that cross-cultural competencies and digital alliance capabilities act as effective governance mechanisms to effectively coordinate IOI activities and communicate with culturally distant partners. In this sense, this study contributes to existing OI research as, to the best of our knowledge, it is the first study that has developed and empirically tested an integrative research model to assess the effect of IOI on international market success as well as the moderating role of cross-cultural competencies and digital alliance capability. Such studies are also rare in the context of EMs' firms as these firms are rapidly expanding into foreign markets; thus, this study provides important insights on this topic in the context of SMEs originating from an EM.

### *5.2 Practical and policy implications*

Beyond its theoretical ones, our study has important practical implications. First, its findings provide guidance suited to aid ESMEs in the UAE in improving their international market success utilizing IOI. In particular, our study shows that IOI is a vital determinant of international market success in the UAE setting. Whereas innovation capacity is generally low among ESMEs in the Middle East, it appears that UAE ESMEs pursue IOI to harvest interests in innovation and advanced technologies, which ultimately result in international market success. Thus, the managers of UAE ESMEs are advised to pay particular attention

to investing in IOI to achieve competitive gains by developing international networks and alliances to benefit from fine-grained knowledge. Second, our study shows that cross-cultural competencies strengthen the positive effect of IOI on international market success. This, ESME managers should observe that the possession of higher cross-cultural competencies is advantageous when ESMEs need to exploit IOI. For example, when such competencies are available, ESMEs are motivated to become involved in IOI because they can easily understand the alliance tasks and effectively share information with culturally distant partners. These findings are important for ESMEs in developing and emerging countries, such as the UAE, given their lack of resources and institutional support, compared to developed markets. Third, our findings suggest that digital alliance capabilities moderate the impact of IOI on international market success. Therefore, ESMEs need to invest in the development of such capabilities, which can help managers to virtually govern their alliance tasks, digitally communicate with international partners and promote mutual learning activities. By doing so, ESMEs can generate higher returns from IOI in terms of international market success. The findings also provide EM policy makers with vital and useful insights. As EM policy makers are keen to develop their economies – and that the internationalization of small firms is among their most important policy agenda items – they need to provide institutional support and expose small firms to international networks, such as trade fairs and research institutes, to enable such firms to leverage international networks of knowledge and develop their capabilities for a rapid internationalization. Policy makers could also provide special incentives, such as vouchers for innovation, to small firms that are rapidly expanding into foreign markets and utilizing international sources of knowledge. Furthermore, policy makers should support small firms by identifying international sources of knowledge and innovation and by connecting rapidly internationalizing firms to the related networks.

## 6. Limitations and future research directions

Despite its contributions, our study has several limitations that offer avenues for future research. First, we did not consider the individual-level factors that may affect the IOI–international market success nexus. For instance, the characteristics of individuals, such as entrepreneurial alertness (Tang *et al.*, 2012), ambiguity tolerance (Begley and Boyd, 1987) or entrepreneurial passion (Chen *et al.*, 2009) may moderate the direct hypothesized path. Thus, we would recommend that future research consider the moderating role played by these factors. Future studies could divide discriminate between inbound and outbound OI to explore their effects on international market success. Another possible setting for further research could be the business-to-business context. Second, we relied on self-reported measures, requiring our respondents to provide information about past events, which often suffers from retrospective bias. Thus, future research could utilize secondary and longitudinal data to overcome this bias. Third, the empirical context of our study was the UAE; therefore, our findings should be interpreted in the context of other EMs. Although the UAE is a unique empirical context, other EMs – like Pakistan, India and Indonesia – may have unique contextual (specifically, institutional) conditions that could offer additional insights for practice and theory development. Accordingly, scholarly attention could be devoted to exploring these relationships from the perspective of other developing and emerging countries. Third, future studies could pay more attention to the type of knowledge being transferred through international networks and to how SMEs based in EMs internalize that knowledge to improve their international performance. Fourth, intermediaries can play a vital role in IOI; therefore, future studies could examine such role and how intermediaries facilitate IOI networks and strategies. There is a scope to examine both the success- and failure-related factors of IOI across different types of SMEs. Fifth, future studies could pay

more attention to the way firms develop their internal cultures for IOI and whether domestic and international sources of knowledge provide equal opportunities to all types of firms. Future studies could also explore how firms develop a more central position in a given network to get fine-grained knowledge and develop different types of innovation. Finally, future studies could specifically analyze the role played by governments in relation to IOI and ESME performance (including market success).

---

## 7. Conclusion

We proposed a link between IOI and ESME international market success. Furthermore, we argued that the link between IOI and ESME international market success would be moderated by cross-cultural competencies and digital alliance capabilities. Our findings suggest a significant and positive relationship between IOI and international market success, and also show that both cross-cultural competencies and digital alliance capabilities positively moderate such relationship. Overall, our study contributes to the international marketing and innovation management literature by illustrating the specific conditions under which IOI leads to the international market success of ESMEs.

### Note

1. A three-year period was used to assess ESME international market success following prior international studies (He and Wei, 2011; Xiao *et al.*, 2021). This application indicates sustained success as it can balance the short-term fluctuations of ESME international market success (Gerschewski *et al.*, 2015).
