

THE LABOUR MARKET

Employment

Past Commentaries have noted the many revisions made to official estimates of employment, including those made in May 1994, following the selection of a revised panel of employers who form the basis for the procedures to estimate total employment. Recently the Department of Employment revised its estimates of employees in employment, particularly in the construction industry. In Britain as a whole the revisions added around 120,000 extra jobs in the construction industry. This helps in part to resolve the puzzle of apparently "jobless recovery".

Data on employment are generally founded upon employer-based sample surveys which are benchmarked to a biennial Census of Employment (to be replaced by the Annual Employment Survey this year). Recently, the results of the September 1993 Census of Employment have become available (the first full Census since 1981, though sample censuses were taken in 1984, 1987, 1989 and 1991), and this, together with some revisions to the 1991 Census, has led to revisions of the estimates of employees in employment back to December 1989 (on a seasonally unadjusted basis). Furthermore, the 1993 Census results have been classified according to Standard Industrial Classification 1992 (SIC 92), which replaces SIC 80, and gives greater disaggregation of the (now substantially larger) services sectors.

The most recent estimates of employees in employment are given in Tables 1 and 2. Table 1 provides both the original and revised estimates of broad employment aggregates. As of the Census date (September 1993) Scotland's estimated total of employees in employment was revised downwards by 30,000 (the biggest such revision) while the estimate of employment in the South East was increased by 69,000 (the largest upwards revision). From the March 1994 estimates reported in Table 1 it is clear that estimates of male employment were revised downwards by substantially less (5,000, all part-time) than female employment (25,000, of which 14,000 is part-time). This reduction in estimated employment is concentrated in manufacturing industries (-44,000 or nearly 13%), though this partly reflects a re-classification of workers in engineering and food manufacturing

to service sectors. This accounts for the increase in the estimate of employees in employment in services (of around 9,000).

The most recent employment data are for March 1996 and these are also reported in Tables 1 and 2. Overall, total employees in employment fell by around 13,000 (0.7%) in the year to March 1996. Full-time male employees in employment fell by 7,000 (0.8%), and full-time female employment fell by 6,000 (1.1%). Part-time male employment fell by 2,000 (2.1%) and part-time female employment rose by 1,000 or 0.2%.

Table 2 presents only the revised estimates of employees in employment by sector because of the difficulties of comparison across different SICs. Over the year to March 1996, the biggest employment losses occurred in service industries. Employment fell by 5,000 in Wholesale etc. (1.7%) and by 4,000 in Financial Intermediation (5.4%) and Real Estate etc. (2.0%). Employment growth was greatest in Manufacturing industries (4,000 or 1.3%).

Vacancies: stocks and flows

Over the year to July 1996 unfilled vacancies at job centres in Scotland fluctuated between 23.1 (22.6) and 25.7 (26.1) thousands on a seasonally adjusted (unadjusted) basis (Table 3). Vacancies rose by 2 thousand in the year to July 1996, on a seasonally adjusted basis. There were still large gross flows, however (Table 4). These were of a similar order of magnitude to the outstanding stock of vacancies in each month. For example, in July 1996 inflows were 25.2 thousand and outflows were 23.9 thousand. The short average duration of vacancies is a sign that employers on average do not find it difficult to fill posts because of a continuing slackness in the labour market (although employers may still find it difficult to recruit specific skills in particular locations).

Unemployment: stocks and flows

Recent data on the seasonally adjusted unemployment stock are presented in Table 5. The most recent data, of course, reflect the current rules governing eligibility to claim benefit which have

been in place since September 1988. These reflect the extension of a guaranteed offer of a YTS place to all those under 18 who have not found a job, under the Employment Training Scheme. Under 18s are consequently not entitled to claim benefit and so are excluded from the unemployment count.

Over the year to July 1996 total unemployment fell by about 4 thousand, from 198.7 thousand and from 8.2% to 8.0% of the working population. This represents a reduction in the level of unemployment of 2.0%. Female unemployment was unchanged over the year, while male unemployment fell by 4 thousand.

Table 6 presents recent flows into and out of the unemployment stock. In July 1996 inflows were, at 45.1 thousand, about 1.2 thousand more than in the same month of 1995. Outflows were, at 29.5 thousand, 0.4 thousand less than in July 1995. If gross outflows were maintained at their July 1996 level unemployment stocks could turnover in less than 7 months.

The August 1995 Employment Gazette reported labour force projections for UK regions from 1994 to 2006. Alone among the standard UK regions Scotland is projected to experience a small decline in its labour force (of 0.2%) over the period. This reflects the combined effects of a 3.7% projected fall in the male and a 4.2% rise in the female labour force. In GB as a whole the aggregate labour force, in contrast, is projected to grow by 5.8% again concentrated among females. These projected trends reflect differences in region's demographic structure, activity rates and in net migration patterns. Small increases in Scottish activity/participation rates of the scale observed in the recent past, could quite easily cause the outcome labour force to differ substantially from these projected levels, however. The outcome will also be very sensitive to induced migration flows.

DELOITTE & TOUCHE SCOTTISH CHAMBERS' BUSINESS SURVEY EVIDENCE: SECOND QUARTER 1996

Results from the latest Deloitte & Touche Scottish Chambers' Business Survey suggests only slow changes in the labour market. Overall, changes to employment levels affected a third of Retail and Finance respondents, less than 40% of Tourism and less than 50% of Manufacturing and Construction respondents. Rising trends in employment were reported in Manufacturing, Retail and Tourism, whilst employment fell in other sectors. Rising

trends in employment for the third quarter are forecast in Manufacturing, Retail and Tourism, however, in the service sector rising employment continues to be largely part time and temporary.

Employment

Only 5% of Manufacturing and 10% Construction respondents thought shortages of skilled labour would be the factor most likely to restrict activity in the third quarter. In contrast concerns as to recruiting suitable staffs were more evident in the service sector.

The rise in Manufacturing employment was less than anticipated at a net of 2%, and no improvement to this rate of increase is forecast for the third quarter. Overall 22% reported increasing employment, however, 20% reduced employment, even so changes to employment levels affected less than 50% of respondents. The continued decline in the levels of overtime working is further evidence of the relative slackness in demand.

Construction employment trends were weaker than anticipated, 29% reported reducing employment and 24% plan to reduce employment in quarter three, whilst only 17% increased employment and 12% expect to increase employment in quarter three. Once again overtime levels continued to decline.

Changes in employment levels in Wholesale were at the margin, affecting less than 25% of respondents. Nevertheless, the employment trends were weaker than expected, and whilst the downward trend eased no improvement to the current decline is forecast. The weakness in demand was reflected in the slight decline in overtime working, and little improvement in overtime working is anticipated in the third quarter.

Changes to Retail employment affected less than a third of respondents. Nevertheless, the rise in employment, a net of 7%, was stronger than anticipated, and the highest figure for more than two years. A further increase in employment is forecast for the third quarter. However, the rising trends conceal a fall in full time and a rise in part time and temporary staffs.

In Finance changes to employment levels affected only a third, and the decline in employment was less than anticipated. Once again the overall decline concealed increased use of part time and temporary staffs. Respondents continue to remain pessimistic as to employment levels and forecast further

declines in the third quarter.

Changes to Tourism employment levels affected less than 40%, nevertheless, 31% reported increasing employment and only 7% reducing employment in the second quarter. The forecast rise in employment occurred, a net of 24%, and this strong rise is expected to continue through the third quarter, reflecting the seasonal nature of demand. A strong rise in the use of temporary and part time staffs was evident and this is expected to continue, outpacing the increasing use of full time staffs.

Recruitment

There were few signs of increased recruitment activity in Manufacturing where 53% sought to recruit, almost the same percentage as reported in the second quarters of 1994 and 1995. Recruitment difficulties were limited, with less than 14% of respondents reporting problems, and were mainly experienced in the recruitment of suitable skilled, managerial and technical staffs.

Recruitment activity in Construction was lower than in previous second quarters, 45% sought to recruit and some difficulties were evident in the recruitment of suitable skilled manual staff, but generally these difficulties were less than a year ago.

The percentage of Wholesale respondents seeking to recruit was lower than in the second quarters of 1995 and 1994. The 39% of Wholesale respondents recruiting staff reported few problems in attracting suitable staffs.

In Retail 63% sought to recruit, the highest quarter two figures for more than two years. Part time staffs were the most widely recruited group, and problems were evident in the recruitment of suitable skilled and part time staffs. Evidence as to the increased activity was reflected in the increased levels of training, again the highest figures for more than two years.

In Finance activity was most frequently directed towards the recruitment of part time and temporary staffs, and some problems were evident in the recruitment of suitable part time staffs.

90% of Tourism respondents sought to recruit a broad range of occupations. Problems in recruiting suitable skilled and part time staffs were evident.

Pay

The percentages increasing pay ranged from 21% of Construction to a third in Manufacturing, 40% in Tourism and 55% of Retail respondents. Upward pressure on pay rates remained slight and was only evident in Wholesale and Retail Distribution. Pay increases for the first half of 1996 have averaged between 3.8% to 4.0%.
