STABILIZED FINITE ELEMENT METHODS BASED ON MULTISCALE ENRICHMENT FOR THE STOKES PROBLEM

RODOLFO ARAYA†, GABRIEL R. BARRENECHEA†, AND FRÉDÉRIC VALENTIN‡

Abstract. This work concerns the development of stabilized finite element methods for the Stokes problem considering nonstable different (or equal) order of velocity and pressure interpolations. The approach is based on the enrichment of the standard polynomial space for the velocity component with multiscale functions which no longer vanish on the element boundary. On the other hand, since the test function space is enriched with bubble-like functions, a Petrov–Galerkin approach is employed. We use such a strategy to propose stable variational formulations for continuous piecewise linear in velocity and pressure and for piecewise linear/piecewise constant interpolation pairs. Optimal order convergence results are derived and numerical tests validate the proposed methods.

Key words. Stokes equation, multiscale functions, SIMPLEST element, bubble function

1. Introduction. Finite element solution of the Stokes problem poses the basic problem of satisfying the discrete Babuska–Brezzi (or inf-sup) condition (see [24] and the references therein). This is indeed a restriction from the point of view of implementation since equal order velocity and pressure spaces do not satisfy this condition. On the other hand, the minimal space to imagine, namely continuous piecewise linear polynomials for the velocity and piecewise constant polynomials for the pressure, does not satisfy this condition either.

Several solutions have been proposed to overcome this restriction, starting with that in [11] and the first consistent method in [28]. Moreover, in [23, 27, 29, 34] the possibility of considering discontinuous spaces for the pressure was considered and justified. On the other hand, in [14, 13], the idea from [16] has been used to propose a new kind of stabilized finite element methods, with stabilizing terms now containing only jump terms across the interelement boundaries. For an overview of stabilized finite element methods for the Stokes problem, see [19] and [5].

On the other hand, the theoretical justification of stabilized methods has become a subject of interest in the last decade. In [2, 3, 4, 31], the connection between stabilized finite element methods and Galerkin methods enriched with bubble functions has been used to propose new stabilized finite element methods for Stokes-like and linearized Navier–Stokes problems. Also, in [22] macro bubbles were used to derive a method analogous to the locally stabilized method from [29] containing jump terms across the interelement boundaries of the macroelements. In the resulting method, the stabilizing
terms are defined over the macroelements, and there is no error analysis or numerical validation of the method. All these works used the so-called bubble condensation procedure, i.e., eliminating the bubble function at the element level and writing the method as the Galerkin part, plus a term derived from the influence of the bubble functions on the formulation. A particular kind of bubble enrichment of the velocity space is the so-called residual-free bubble (RFB) method (cf. [7, 8, 12]), in which the bubble function is now the solution of a problem containing the residual of the continuous equation at the element level (see [9, 10, 32] for the a priori error analysis). This bubble part may be analytically condensed or numerically computed. In the latter case this procedure leads to the two-level finite element method.

The imposition of a zero boundary condition on the element boundary for the RFB has led to some numerical problems. Solutions for these problems have been proposed by relaxing the zero boundary condition, such as the discontinuous enrichment method [18] (for the Helmholtz equation), and, more recently, the multiscale finite element method; see [21], where the main idea may be found, and [20], where the a priori error analysis is performed (for the reaction-diffusion equation, an a posteriori error estimator based on this idea has been proposed and analyzed in [1]). A particularity of such methods is that a Petrov–Galerkin strategy is proposed, in which the test function space is enriched with bubble functions in order to have a local problem containing the residual of the momentum equation on the right-hand side. A special boundary condition (related to the one used in [25, 26, 15]) is imposed in order to solve these local problems analytically. The resulting method is of Petrov–Galerkin type, in which the trial function space is generated by a basis formed by the addition of usual polynomial basis functions and enrichment functions from the solution of the differential problem in each element (which are now, unlike the RFB, known analytically, and hence the method is not of a two-level finite element method type), and in which the test function space is the standard polynomial space.

The purpose of this work is to use the multiscale approach from [21, 20], combined with the static condensation procedure, in order to propose new stabilized finite element methods for the Stokes problem. We proceed as in [21], defining an enrichment function for the trial space for the velocity that no longer vanishes on the element boundary (and hence it is not a bubble function), and then we split it into a bubble part and a function being a harmonic extension of the boundary condition. This boundary condition comes from the solution of an elliptic ODE containing a part of the differential operator at the boundary, and a jump term as the right-hand side. Depending on the jump term chosen, this procedure will lead to different methods. Both functions are condensed, and hence we obtain a method which includes the usual Galerkin-Least-Squares (GLS) stabilizing terms at the element level, plus a positive jump term on the interelement boundaries, each one with a proper stabilization parameter. One special feature of these new methods is that the previously mentioned ODE at the element boundary may be solved analytically, and hence the stabilization parameter associated with the jump terms is known exactly.

The plan of the paper is as follows. In section 2 we present the general framework and derive a general form of the method. In sections 3 and 4 this framework is applied to derive concrete stabilized finite element methods for two families of interpolation spaces, namely $P_1/P_0$ and continuous $P_1/P_1$ elements. For both cases optimal order a priori error estimates are derived for the natural norms of the unknowns, plus some extra control on the norm of the jumps appearing in the formulation. As we already mentioned, if we change the right-hand side on the boundary condition, we can derive a new method. This is done in section 5, where we give an alternative enrichment
strategy leading to another family of methods, whose analysis is analogous to that of sections 3 and 4, and which contains a boundary term containing the residual of the Cauchy stress tensor on the internal edges of the triangulation. Numerical experiments confirming the theoretical results and comparing the performance of all the methods are presented in section 6, and some final remarks and conclusions are given in section 7.

2. The model problem and the general framework. Let \( \Omega \) be an open bounded domain in \( \mathbb{R}^2 \) with polygonal boundary, \( f \in L^2(\Omega)^d \) and consider the following Stokes problem:

\[
\begin{align*}
-\nu \Delta u + \nabla p &= f, & \nabla \cdot u &= 0 \quad \text{in } \Omega, \\
\hfill u &= 0 \quad \text{on } \partial \Omega,
\end{align*}
\]

where \( \nu \in \mathbb{R}^+ \) is the fluid viscosity.

Now let \( \{ T_h \}_{h > 0} \) be a family of regular triangulations of \( \Omega \), built up using triangles \( K \) with boundary \( \partial K \). Let also \( E_h \) be the set of internal edges of the triangulation, \( h_K := \text{diam}(K) \) and \( h := \max \{ h_K : K \in T_h \} \). Let \( V_h \) be the usual finite element space of continuous piecewise polynomials of degree \( k \), \( 1 \leq k \leq 2 \) with zero trace on \( \partial \Omega \). Let also \( Q_h \) be a space of piecewise polynomials of degree \( l \), \( 0 \leq l \leq 1 \), which may be continuous or discontinuous in \( \Omega \) and which belong to \( L^2(\Omega) \). Let \( H^m(T_h) \) and \( H^m_0(T_h) \) \( (m \geq 1) \) be the spaces of functions whose restriction to \( K \in T_h \) belongs to \( H^m(K) \) and \( H^m_0(K) \), respectively. Furthermore, \( (\cdot, \cdot)_D \) stands for the inner product in \( L^2(D) \) (or in \( L^2(D)^2 \) or \( L^2(D)^{2 \times 2} \), when necessary), and we denote by \( ||\cdot||_{s,D} \) \((||\cdot||_{s,D})\) the norm (seminorm) in \( H^s(D) \) (or \( H^s(D)^2 \), if necessary). As usual, \( H^0(D) = L^2(D) \), and \( \cdot |_{0,D} = ||\cdot||_{0,D} \).

In order to propose a Petrov–Galerkin method for the Stokes problem (1), let \( E_h \subset H^1_0(\Omega) \) be a finite-dimensional space, called a multiscale space, such that \( V_h \cap E_h = \{0\} \). Then, we propose the following Petrov–Galerkin scheme for (1): Find \( u_1 + u_e \in [V_h \oplus E_h]^2 \) and \( p \in Q_h \) such that

\[
\nu(\nabla (u_1 + u_e), \nabla v_h) + (p, \nabla \cdot v_h) + (q, \nabla \cdot (u_1 + u_e)) = (f, v_h)
\]

for all \( v_h \in [V_h \oplus H^1_0(T_h)]^2 \) and all \( q \in Q_h \). Now, this Petrov–Galerkin scheme is equivalent to the following system:

\[
\begin{align*}
(\nu(\nabla (u_1 + u_e), \nabla v_1) + (p, \nabla \cdot v_1) + (q, \nabla \cdot (u_1 + u_e)) = (f, v_1) & \quad \forall (v_1, q) \in V^2_h \times Q_h, \\
(\nu(\nabla (u_1 + u_e), \nabla v_h)_K = (f, v_h)_K & \quad \forall v_h \in H^1_0(K)^2 \forall K \in T_h .
\end{align*}
\]

Equation (3) above is equivalent to

\[
(-\nu \nabla u_e, v_h)_K = (f + \nu \Delta u_1 - \nabla p, v_h)_K \quad \forall v_h \in H^1_0(K)^2,
\]

which, in strong form, may be written as

\[
-\nu \Delta u_e = f + \nu \Delta u_1 - \nabla p \quad \text{in } K.
\]
condition on \( u_e \):

\[
\begin{align*}
\mathbf{u}_e &= \mathbf{g}_e \quad \text{on each } Z \subset \partial K, \\
\end{align*}
\]

where \( \mathbf{g}_e = \mathbf{0} \) if \( Z \subset \partial \Omega \), and \( \mathbf{g}_e \) is the solution of

\[
\begin{align*}
-\nu \partial_{ss} \mathbf{g}_e &= \frac{1}{h_Z} [\nu \partial_n \mathbf{u}_1 + p \mathbf{I} \cdot \mathbf{n}] \quad \text{in } Z, \\
\mathbf{g}_e &= \mathbf{0} \quad \text{at the nodes},
\end{align*}
\]

on the internal edges, where \( h_Z = |Z| \), \( \mathbf{n} \) is the normal outward vector on \( \partial K \), \( \partial_s \), and \( \partial_n \) are the tangential and normal derivative operators, respectively, \( [v] \) stands for the jump of \( v \) across \( Z \), and \( \mathbf{I} \) is the \( \mathbb{R}^{2 \times 2} \) identity matrix.

**Remark 2.1.** Both the shape of the jump term and the \( h_Z^{-1} \) coefficient on the boundary condition have been suggested by the error analysis. On the other hand, if we impose as the right-hand side in (6) the residual of the Cauchy stress tensor on \( \partial K \), we have another class of methods. This alternative will be analyzed in section 5.

Now, on each \( K \in T_h \), we can write \( \mathbf{u}_e|_K = \mathbf{u}_e^K + \mathbf{u}_e^\partial K \), where

\[
\begin{align*}
-\nu \Delta \mathbf{u}_e^K &= f + \nu \Delta \mathbf{u}_1 - \nabla p \quad \text{in } K, \\
\mathbf{u}_e^K &= \mathbf{0} \quad \text{on } \partial K,
\end{align*}
\]

and

\[
\begin{align*}
-\nu \Delta \mathbf{u}_e^\partial K &= \mathbf{0} \quad \text{in } K, \\
\mathbf{u}_e^\partial K &= \mathbf{g}_e \quad \text{on } \partial K,
\end{align*}
\]

where \( \mathbf{g}_e \) is the solution of (6). Such differential problems are well posed, and (3) is immediately satisfied.

In this way, we can define two operators \( \mathcal{M}_K : L^2(K)^2 \rightarrow H^1_0(K)^2 \) and \( \mathcal{B}_K : L^2(\partial K)^2 \rightarrow H^1(\partial K)^2 \) such that

\[
\begin{align*}
\mathbf{u}_e^K &= \frac{1}{\nu} \mathcal{M}_K (f + \nu \Delta \mathbf{u}_1 - \nabla p) \quad \forall K \in T_h
\end{align*}
\]

and

\[
\begin{align*}
\mathbf{u}_e^\partial K &= \frac{1}{\nu} \mathcal{B}_K ([\nu \partial_n \mathbf{u}_1 + p \mathbf{I} \cdot \mathbf{n}]) \quad \forall K \in T_h.
\end{align*}
\]

Next, since the enriched part \( \mathbf{u}_e \) is fully identified through (9)–(10) (or, equivalently, by (7)–(8)), we can perform statical condensation to derive a stabilized finite element method for our problem (1). First, integrating by parts, we have, on each \( K \in T_h \),

\[
\begin{align*}
\nu (\nabla \mathbf{u}_e, \nabla \mathbf{v}_1)_K &= -\nu (\mathbf{u}_e, \Delta \mathbf{v}_1)_K + (\mathbf{u}_e, \nu \partial_n \mathbf{v}_1)_{\partial K}, \\
(q, \nabla \cdot \mathbf{u}_e)_K &= -\nu (\mathbf{u}_e, \nabla q)_K + (\mathbf{u}_e, q \mathbf{I} \cdot \mathbf{n})_{\partial K}.
\end{align*}
\]

Using these identities we can rewrite (2) in the following way:

\[
\begin{align*}
\nu (\nabla \mathbf{u}_1, \nabla \mathbf{v}_1)_\Omega + \sum_{K \in T_h} \left[ - (\mathbf{u}_e, \nu \Delta \mathbf{v}_1)_K + (\mathbf{u}_e, \nu \partial_n \mathbf{v}_1)_{\partial K} \right] - (p, \nabla \cdot \mathbf{v}_1)_\Omega \\
+ (q, \nabla \cdot \mathbf{u}_1)_\Omega + \sum_{K \in T_h} \left[ - (\mathbf{u}_e, \nabla q)_K + (\mathbf{u}_e, q \mathbf{I} \cdot \mathbf{n})_{\partial K} \right] = (f, \mathbf{v}_1)_\Omega,
\end{align*}
\]
which implies
\[
\nu(\nabla u_1, \nabla v_1)_\Omega - (p, \nabla \cdot v_1)_\Omega + (q, \nabla \cdot u_1)_\Omega
\]
\[
+ \sum_{K \in T_h} \left[ -(u_e, \nu \Delta v_1 + \nabla q)_K + (u_{eK}^\nu, \nu \partial_n v_1 + q I \cdot n)_{\partial K} \right] = (f, v_1)_\Omega,
\]
which, applying characterizations (9)–(10), becomes
\[
\nu(\nabla u_1, \nabla v_1)_\Omega - (p, \nabla \cdot v_1)_\Omega + (q, \nabla \cdot u_1)_\Omega
\]
\[
+ \sum_{K \in T_h} \left[ \frac{1}{\nu} (M_K(-\nu \Delta u_1 + \nabla p) - B_K([\nu \partial_n u_1 + p I \cdot n]), \nu \Delta v_1 + \nabla q)_K \right.
\]
\[
+ \left. \frac{1}{\nu} (B_K([\nu \partial_n u_1 + p I \cdot n]), \nu \partial_n v_1 + q I \cdot n)_{\partial K} \right] = (f, v_1)_\Omega + \sum_{K \in T_h} \frac{1}{\nu} (M_K(f), \nu \Delta v_1 + \nabla q)_K.
\]

Using this form, in the next sections we will present concrete stabilized finite element methods for both the simplest possible pair ($P^1/P^0$ elements) and equal order $P^1/P^1$ continuous finite elements.

### 3. The simplest element $P^1/P^0$.

#### 3.1. The method.

For this case, the finite element spaces are given by
\[
V_h := \{ v \in C^0(\Omega)^2 : v|_K \in P^1(K)^2 \forall K \in T_h \} \cap H^1_0(\Omega)^2
\]
for the velocity, and
\[
Q^0_h := \{ q \in L^2_0(\Omega) : q|_K \in P^0(K) \forall K \in T_h \}
\]
for the pressure. Using these spaces, we propose the following stabilized method: Find $(u_1, p_0)$ in $V_h \times Q^0_h$ such that
\[
B_0((u_1, p_0), (v_1, q_0)) = F_0(v_1, q_0) \quad \forall (v_1, q_0) \in V_h \times Q^0_h,
\]
where
\[
B_0((u_1, p_0), (v_1, q_0)) := \nu(\nabla u_1, \nabla v_1)_\Omega - (p_0, \nabla \cdot v_1)_\Omega + (q_0, \nabla \cdot u_1)_\Omega
\]
\[
+ \sum_{Z \in \mathcal{E}_h} \tau_Z ([\nu \partial_n u_1 + p_0 I \cdot n], [\nu \partial_n v_1 + q_0 I \cdot n])_Z,
\]
\[
F_0(v_1, q_0) := (f, v_1)_\Omega,
\]
and $\tau_Z$ is given by
\[
\tau_Z := \frac{h_Z}{12\nu}.
\]

**Remark 3.1.** This method differs somewhat from other existing stabilized finite element methods with discontinuous pressure spaces (see, for example, [23, 29, 34, 14]).
First, since \( \tau_Z \) is known exactly, we have no free constants to set. To the authors’ knowledge, this is the first time that the stabilization parameter corresponding to jump terms is known exactly. Furthermore, and in contrast to [22], the jump terms are derived without the use of a macroelement technique. Finally, another difference is the nature of the jump terms, not only containing pressure jumps, but also the jump on the normal derivative of \( \mathbf{u} \).

Remark 3.2. One of the drawbacks of the RFB method for the Stokes problem is that, due to the zero boundary condition on the element boundary, there is not a bubble-based enrichment that makes stable the \( \mathbb{P}^1/\mathbb{P}^0 \) element (see [6] for a discussion), and hence, the use of a different boundary condition makes it possible to stabilize the \( \mathbb{P}^1/\mathbb{P}^0 \) element.

3.1.1. Derivation of the method. First we note that, using spaces \( \mathbf{V}_h \) and \( Q^0_h \), (13) reduces to the following: Find \((\mathbf{u}_1, p_0) \in \mathbf{V}_h \times Q^0_h \) such that

\[
\nu(\nabla \mathbf{u}_1, \nabla \mathbf{v}_1)_\Omega - (p_0, \nabla \cdot \mathbf{v}_1)_\Omega + (q_0, \nabla \cdot \mathbf{u}_1)_\Omega \\
\quad + \sum_{Z \in \mathcal{E}_h} \frac{1}{\nu} (\mathcal{B}_k ([\nu \nabla \cdot \mathbf{u}_1 + p_0 \mathbf{I} \cdot \mathbf{n}]), [\nu \nabla \cdot \mathbf{v}_1 + q_0 \mathbf{I} \cdot \mathbf{n}])_Z = (f, \mathbf{v}_1)_\Omega
\]

for all \((\mathbf{v}_1, q_0) \in \mathbf{V}_h \times Q^0_h \).

Remark 3.3. Since \( \mathcal{B}_K \) is the inverse of an elliptic operator, by denoting \( \mathbf{v} = \mathcal{B}_K(\mathbf{g}) \), we have, for all \( \mathbf{g} \in L^2(\partial K)^2 \),

\[
(\mathcal{B}_K(\mathbf{g}), \mathbf{g})_{\partial K} = -(\mathbf{v}, \partial_{ss} \mathbf{v})_{\partial K} = (\partial_s \mathbf{v}, \partial_s \mathbf{v})_{\partial K} \geq 0,
\]

and hence we are adding a positive term to the formulation.

Next we exploit the fact that \([\partial_n \mathbf{u}_1 + p_0 \mathbf{I} \cdot \mathbf{n}]_Z \) is a constant function. To do so, we define the (matrix) function \( \mathbf{b}_K^s := (\mathcal{B}_K(e_1) | \mathcal{B}_K(e_2)) \), where \( e_1, e_2 \) are the canonical vectors in \( \mathbb{R}^2 \), and we remark that, from its definition, \( \mathbf{b}_K^s = \mathbf{b}_K^r \mathbf{I} \), where \( \mathbf{b}_K^s \) is the solution of

\[
-\Delta \mathbf{b}_K^s = 0 \quad \text{in } K, \quad \mathbf{b}_K^s = \mathbf{g}(s) \quad \text{on each } Z \subset \partial K,
\]

where \( g = 0 \) if \( Z \subset \partial \Omega \), and \( g \) satisfies

\[
-\partial_{ss} \mathbf{g}(s) = \frac{1}{h_Z} \quad \text{in } Z, \quad \mathbf{g} = 0 \quad \text{at the nodes},
\]

in the internal edges.

Remark 3.4. The solution of (20) may be calculated explicitly and it is not difficult to realize that

\[
\frac{(\mathbf{b}_K^s)^1_Z}{|Z|} = \frac{h_Z}{12}.
\]

Finally, since \([\partial_n \mathbf{u}_1 + p_0 \mathbf{I} \cdot \mathbf{n}]_Z \) is a constant function we obtain

\[
(\mathcal{B}_K ([\nu \nabla \cdot \mathbf{u}_1 + p_0 \mathbf{I} \cdot \mathbf{n}]), [\nu \nabla \cdot \mathbf{v}_1 + q_0 \mathbf{I} \cdot \mathbf{n}])_Z \\
= \left[ \int_Z \mathbf{b}_K^s \cdot [\nu \nabla \cdot \mathbf{u}_1 + p_0 \mathbf{I} \cdot \mathbf{n}]_Z \partial_s [\nu \nabla \cdot \mathbf{v}_1 + q_0 \mathbf{I} \cdot \mathbf{n}]_Z \right] \\
= \frac{(\mathbf{b}_K^s)^1_Z}{|Z|} ([\nu \nabla \cdot \mathbf{u}_1 + p_0 \mathbf{I} \cdot \mathbf{n}], [\nu \nabla \cdot \mathbf{v}_1 + q_0 \mathbf{I} \cdot \mathbf{n}])_Z,
\]
and hence replacing this in (18) and using the previous remark, we obtain method (14).

3.2. Error analysis. From now on, $C$ will denote a positive constant independent of $h$ and $\nu$, and that may change its value whenever it is written in two different places.

The next result states the consistency of the proposed method.

**Lemma 3.5.** Let $(u, p) \in [H^2(\Omega) \cap H^1_0(\Omega)]^2 \times [H^1(\Omega) \cap L^2(\Omega)]$ be the weak solution of (1) and $(u_1, p_0)$ the solution of (14). Then,

$$B_0((u - u_1, p - p_0), (v_1, q_0)) = 0 \quad \forall (v_1, q_0) \in V_h \times Q_h.$$  

**Proof.** The results follows by noting that $[\nu \partial_n u + \nu \cdot n] = 0$ a.e. across all the internal edges.

Moreover, defining the mesh-dependent norm

$$\| (v, q) \|_h := \left[ \nu |v|_1^2 + \sum_{Z \in E_h} \tau_Z \| [\nu \partial_n v + q \nu \cdot n] \|_{0, Z}^2 \right]^{1/2},$$

we have the following continuity and coercivity results.

**Lemma 3.6.** Let be $(v, q), (w, r) \in [H^2(T_h) \cap H^1(T_h)]^2 \times [H^1(T_h) \cap L^2(T_h)]$. Then, bilinear form $B_0$ satisfies

$$B_0((v, q), (w, r)) \leq \| (v, q) \|_h \| (w, r) \|_h + (\nabla \cdot v, r)_{\Omega} - (q, \nu \cdot w)_{\Omega},$$

$$B_0((v, q), (v, q)) = \| (v, q) \|_h^2.$$

**Proof.** The result follows immediately from the definition of $B_0$. 

In order to perform the numerical analysis of this method, we will consider the Lagrange interpolation operator $I_h : C^0(\overline{\Omega}) \to V_h$ (if $v = (v_1, v_2) \in C^0(\overline{\Omega})^2$, we denote $I_h(v) = (I_h(v_1), I_h(v_2))$) to approximate the velocity. Then, it is well known (cf. [17]) that

$$|v - I_h(v)|_{m,K} \leq C h^{2-m} \| v \|_{2,K} \quad \forall v \in H^2(K),$$

$$|v - I_h(v)|_{t,Z} \leq C h^{2-t-1/2} \| v \|_{2,\omega_Z} \quad \forall v \in H^2(\omega_Z)$$

for all $K \in T_h, Z \in E_h$, where $\omega_Z \coloneqq \cup \{ K \in T_h : Z \subset \partial K \}$, and $m = 0, 1, 2, t = 0, 1$. Let us remark that to obtain the second estimate above, we used the following local trace theorem (for a proof, see [33]): There exists $C > 0$, independent of $h$, such that

$$\| v \|_{0, \partial K}^2 \leq C \left( \frac{1}{h_K} \| v \|_{0,K}^2 + h_K \| v \|_{1,K}^2 \right)$$

for all $v \in H^1(K)$.

In order to approximate the pressure we will consider $\Pi_h : L^2(\Omega) \to Q_h^0$ as the $L^2(\Omega)$-projection onto $Q_h^0$. This projection satisfies (cf. [17])

$$\| q - \Pi_h(q) \|_{0,\Omega} \leq C h \| q \|_{1,\Omega}$$
if \( q \in H^1(\Omega) \), and hence, using the local trace theorem (28), we obtain

\[
(30) \quad \left[ \sum_{K \in \mathcal{T}_h} h_K \| q - \Pi_h(q) \|_{0,K}^2 \right]^{1/2} \leq C h |q|_{1,\Omega}
\]

for all \( q \in H^1(\Omega) \).

**Lemma 3.7.** Suppose \((v, q) \in H^2(\Omega)^2 \times H^1(\Omega) \). Then,

\[
(31) \quad \|(v - I_h(v), q - \Pi_h(q))\|_h \leq Ch \left( \sqrt{\nu} |v|_{2,\Omega} + \frac{1}{\sqrt{\nu}} |q|_{1,\Omega} \right).
\]

**Proof.** The result follows immediately from the norm definition and (26), (27), (30). \(\Box\)

Using previous results we can establish the following convergence result.

**Theorem 3.8.** Let \((u, p) \in [H^2(\Omega) \cap H_0^1(\Omega)]^2 \times [H^1(\Omega) \cap L_0^2(\Omega)]\) be the solution of (1) and \((u_1, p_0)\) the solution of (14). Then, the following error estimate holds:

\[
(32) \quad \|(u - u_1, p - p_0)\|_h \leq Ch \left( \sqrt{\nu} |u|_{2,\Omega} + \frac{1}{\sqrt{\nu}} |p|_{1,\Omega} \right).
\]

**Proof.** Let \((\tilde{u}_h, \tilde{p}_h) := (I_h(u), \Pi_h(p)) \in V_h \times Q^0_h\). From Lemmas 3.5 and 3.6 we know that

\[
(33) \quad (\nabla \cdot (u - u_1), p - \tilde{p}_h)_{\Omega} = - (\nabla \cdot u_1, p - \tilde{p}_h)_{\Omega} = 0
\]

since \(u\) is a solenoidal field and \(\nabla \cdot u_1 \in Q^0_h\). On the other hand,

\[
(\nabla \cdot (u - \tilde{u}_h), p - p_0)_{\Omega} = \sum_{K \in \mathcal{T}_h} \left[ - (\nabla p, u - \tilde{u}_h)_K + (p - p_0, (u - \tilde{u}_h) \cdot n)_{\partial K} \right]
\]

\[
= - (\nabla p, u - \tilde{u}_h)_{\Omega} + \sum_{K \in \mathcal{T}_h} ((p - p_0) I \cdot n, u - \tilde{u}_h)_{\partial K}
\]

\[
\leq |p|_{1,\Omega} |u - \tilde{u}_h|_{0,\Omega} + \sum_{Z \in \mathcal{E}_h} \left[ (p - p_0) I \cdot n, u - \tilde{u}_h \right]_{Z}
\]

\[
\leq Ch^2 |p|_{1,\Omega} |u|_{2,\Omega} + C \sum_{Z \in \mathcal{E}_h} h_Z^2 \frac{1}{\sqrt{\nu}} \| (p - p_0) I \cdot n \|_{0,Z} \sqrt{\nu} |u|_{2,\Omega,Z}
\]

\[
\leq Ch^2 |p|_{1,\Omega} |u|_{2,\Omega} + \frac{1}{\gamma} \sum_{Z \in \mathcal{E}_h} h_Z^2 \nu \| (p - p_0) I \cdot n \|_{0,Z}^2 + C \gamma \sum_{Z \in \mathcal{E}_h} h^2 \nu |u|_{2,\Omega,Z}^2
\]

\[
\leq Ch^2 \left( (1 + \gamma) \nu |u|_{2,\Omega}^2 + \frac{1}{\nu} |p|_{1,\Omega}^2 \right) + \frac{1}{\gamma} \sum_{Z \in \mathcal{E}_h} h_Z^2 \nu \| (p - p_0) I \cdot n \|_{0,Z}^2 ,
\]

\[ \nabla \cdot \textbf{v} \quad \text{such that} \quad \gamma > 330 \]

R. ARAYA, G. R. BARRENECHEA, AND F. VALENTIN

Hence, choosing \( \gamma = 2\tilde{C} \) we obtain

\[ \frac{1}{2} \| (\textbf{u} - \textbf{u}_1, p - p_0) \|^2_h \leq C h^2 \left( \nu |\textbf{u}|^2_{2, \Omega} + \frac{1}{p} |p|^2_{1, \Omega} \right), \]

and the result follows by extracting the square root. \( \square \)

**Remark 3.9.** The last result gives a convergence result for the velocity, plus a convergence result for the pressure. More precisely, this result implies \( \| \textbf{u} - \textbf{u}_1 \|_{1, \Omega} \leq C h \) and \( \left( \sum_{E \in \mathcal{E}_h} h_E \| \partial_n (\textbf{u} - \textbf{u}_1) + (p - p_0) \textbf{n} \|^2_{0, Z} \right)^{\frac{1}{2}} \leq C h \), which are both optimal in order and regularity.

### 3.2.1. A convergence result for the pressure

The last result of the previous section does not give convergence on the natural norm of the pressure. That is why a convergence result for the pressure in the \( L^2(\Omega) \) norm is now given.

In the proof of the next result we will use the Clément interpolation operator (cf. [17, 24]), \( C_h : H^1(\Omega) \rightarrow V_h \). This operator satisfies

\[ |v - C_h(v)|_{m, \Omega} \leq C h^{1-m} |v|_{1, \Omega} \quad \forall v \in H^1(\Omega) \]

for \( m = 0, 1 \), with the obvious extension to vector-valued functions.

**Theorem 3.10.** Let \( (\textbf{u}, p) \in [H^2(\Omega) \cap H^1_0(\Omega)]^2 \times [H^1(\Omega) \cap L^2(\Omega)] \) be the solution of (1) and \( (\textbf{u}_1, p_0) \) the solution of (14). Then, the following error estimate holds:

\[ \| p - p_0 \|_{0, \Omega} \leq C h \left( \nu |\textbf{u}|_{2, \Omega} + |p|_{1, \Omega} \right). \]

**Proof.** From the continuous inf-sup condition (see [24]), there exists \( \textbf{w} \in H^1_0(\Omega)^2 \) such that \( \nabla \cdot \textbf{w} = p - p_0 \) in \( \Omega \) and \( |\textbf{w}|_{1, \Omega} \leq C \| p - p_0 \|_{0, \Omega} \). Let \( \textbf{w}_h = C_h(\textbf{w}) \). Then,
applying the consistency of the method we obtain
\[
\| p - p_0 \|_{0, \Omega}^2 = (\nabla \cdot w, p - p_0)_{\Omega} = (\nabla \cdot (w - w_h), p - p_0)_{\Omega} + (\nabla \cdot w_h, p - p_0)_{\Omega} \\
= \sum_{K \in T_h} [-(w - w_h, \nabla p)_K + (w - w_h, (p - p_0)I \cdot n)_{\partial K}] \\
+ \nu (\nabla (u - u_1), \nabla w_h)_{\Omega} + \sum_{Z \in E_h} \tau_Z \left( [\nu \partial_n (u - u_1) + (p - p_0)I \cdot n], [\nu \partial_n w_h] \right)_Z
\]

Now, using the local trace theorem (28) and (35) we easily obtain
\[
\text{applying the consistency of the method we obtain}\]
\[
\| p - p_0 \|_{0, \Omega}^2 \leq \left( \sum_{K \in T_h} \frac{\nu^2}{h_K^2} |p|_{1, K}^2 + \sum_{Z \in E_h} \tau_Z \| (p - p_0)I \cdot n \|_{0, Z}^2 + \nu |u - u_1|_{1, \Omega}^2 \right)^{\frac{1}{2}} \\
+ \sum_{Z \in E_h} \tau_Z \left( [\nu \partial_n (u - u_1) + (p - p_0)I \cdot n], [\nu \partial_n w_h] \right)_Z \right) \]
\[
\leq C \sqrt{\nu} |w|_{1, \Omega} \leq C \sqrt{\nu} \| p - p_0 \|_{0, \Omega}. \]

Hence, dividing by \| p - p_0 \|_{0, \Omega} and using (28) again we have
\[
\| p - p_0 \|_{0, \Omega} \\
\leq C \sqrt{\nu} \left( \sum_{K \in T_h} \frac{h_K^2}{\nu} |p|_{1, K}^2 + \nu |u - u_1|_{1, \Omega}^2 \right)^{\frac{1}{2}} \\
+ \sum_{Z \in E_h} \tau_Z \left( [\nu \partial_n (u - u_1) + (p - p_0)I \cdot n], [\nu \partial_n w_h] \right)_Z \right) \]
\[
\leq C \sqrt{\nu} \left( \frac{h_K^2}{\nu} |p|_{1, \Omega}^2 + \|(u - u_1, p - p_0)\|_{h}^2 + \nu h^2 |u_2|_{2, \Omega}^2 \right)^{\frac{1}{2}} \\
\leq C \sqrt{\nu} \left( \frac{h_K^2}{\nu} |p|_{1, \Omega}^2 + \nu h^2 |u_2|_{2, \Omega}^2 \right)^{\frac{1}{2}}, \]

and the result follows. \(\Box\)

3.2.2. An error estimate for \| u - u_1 \|_{0, \Omega}. Throughout this section we will assume that the solution of the following problem, where \((u_1, p_0)\) is the solution of
(14), belongs to \([H^2(\Omega) \cap H^0_0(\Omega)]^2 \times [H^1(\Omega) \cap L^2_0(\Omega)]\): Find \((\varphi, \pi)\) such that

\[
- \nu \Delta \varphi - \nabla \pi = u - u_1, \quad \nabla \cdot \varphi = 0 \quad \text{in} \ \Omega, \\
\varphi = 0 \quad \text{on} \ \partial \Omega.
\]

We also assume that the following estimate holds:

\[
\nu \|\varphi\|_{2, \Omega} + \|\pi\|_{1, \Omega} \leq C \|u - u_1\|_{0, \Omega}.
\]

Theorem 3.11. Let \((u, p) \in [H^2(\Omega) \cap H^0_0(\Omega)]^2 \times [H^1(\Omega) \cap L^2_0(\Omega)]\) be the solution of (1) and \((u_1, p_0)\) the solution of (14). Then, the following error estimate holds:

\[
\|u - u_1\|_{0, \Omega} \leq C h^2 \left( \|u\|_{2, \Omega} + \frac{1}{\nu} |p|_{1, \Omega} \right).
\]

Proof. Let \((\varphi_h, \pi_h) := (I_h(\varphi), \Pi_h(\pi)) \in V_h \times Q^0_h\). Then, multiplying the first equation in (37) by \(u - u_1\) and the second by \(-p - p_0\), from the definition of bilinear form \(B_0\), the regularity of \((\varphi, \pi)\) and the consistency of the method and Lemma 3.6, we obtain

\[
\|u - u_1\|_{0, \Omega}^2 = \nu (\nabla \varphi, \nabla (u - u_1))_\Omega + (\pi, \nabla \cdot (u - u_1))_\Omega - (p - p_0, \nabla \cdot \varphi)_\Omega \\
B_0((u - u_1, p - p_0), (\varphi, \pi)) \\
\leq \|u - u_1\|_h \|\varphi - \varphi_h\|_h + \|p - p_0\|_{0, \Omega} \|\nabla \cdot (\varphi - \varphi_h)\|_{0, \Omega} \\
- (p - p_0, \nabla \cdot (\varphi - \varphi_h))_\Omega + (\pi - \pi_h, \nabla \cdot (u - u_1))_\Omega.
\]

Now, using (33) we see that \((\pi - \pi_h, \nabla \cdot (u - u_1))_\Omega = 0\), and hence, using interpolation inequalities (26), Lemma 3.7 and Theorems 3.8 and 3.10, we arrive at

\[
\|u - u_1\|_{0, \Omega}^2 \\
\leq \|(u - u_1, p - p_0)\|_h \|\varphi - \varphi_h\|_h + \|p - p_0\|_{0, \Omega} \|\nabla \cdot (\varphi - \varphi_h)\|_{0, \Omega} \\
\leq \left[\|u - u_1, p - p_0\|_h^2 + \frac{1}{\nu} |p|_{0, \Omega}^2\right]^{1/2} \left[\|\varphi - \varphi_h\|_h^2 + \nu \|\nabla \cdot (\varphi - \varphi_h)\|^2_{0, \Omega}\right]^{1/2} \\
\leq Ch^2 \left[\nu \|u\|_{2, \Omega}^2 + \frac{1}{\nu} |p|_{1, \Omega}^2\right]^{1/2} \left[\nu |\varphi|^2_{2, \Omega} + \frac{1}{\nu} |\pi|_{1, \Omega}^2\right]^{1/2} \\
\leq C \frac{1}{\sqrt{\nu}} h^2 \left(\sqrt{\nu} \|u\|_{2, \Omega} + \frac{1}{\sqrt{\nu}} |p|_{1, \Omega}\right) \|u - u_1\|_{0, \Omega},
\]

and the result follows. \(\Box\)

4. The method using \(P^1/P^1\) continuous elements.

4.1. The method. For this case, the finite element space for the velocity is the same as in previous section, but the pressure space is now given by

\[
Q^1_h := \{ q \in C^0(\Omega) : q|_K \in P^1(K) \forall K \in T_h \} \cap L^2_0(\Omega).
\]

As we will see in next section, the method coming directly from (13) is given by the following: Find \((\tilde{u}_1, \tilde{p}_1) \in V_h \times Q^1_h\) such that

\[
B_1((\tilde{u}_1, \tilde{p}_1), (v_1, q_1)) = F(v_1, q_1) \quad \forall (v_1, q_1) \in V_h \times Q^1_h,
\]
where

\[
B_1((u_1, p_1), (v_1, q_1)) := B((u_1, p_1), (v_1, q_1)) - \sum_{K \in \mathcal{T}_h} \frac{1}{\nu} (\mathcal{B}_K([\nu \partial_n u_1]), \nabla q_1)_K,
\]

with

\[
B((u_1, p_1), (v_1, q_1)) := \nu(\nabla u_1, \nabla v_1)_\Omega - (p_1, \nabla \cdot v_1)_\Omega + (q_1, \nabla \cdot u_1)_\Omega
\]

\[
+ \sum_{K \in \mathcal{T}_h} \tau_K (-\nu \Delta u_1 + \nabla p_1, \nu \Delta v_1 + \nabla q_1)_K + \sum_{Z \in \mathcal{E}_h} \tau_Z ([\nu \partial_n u_1], [\nu \partial_n v_1])_Z.
\]

\[
F(v_1, q_1) := (f, v_1)_\Omega + \sum_{K \in \mathcal{T}_h} \tau_K (f, \nu \Delta v_1 + \nabla q_1)_K,
\]

\[
\tau_K := C_1 \frac{h_K^2}{\nu},
\]

where \(\tau_Z\) is given by (17) and \(C_1 = \frac{1}{8}\). The value \(C_1 = \frac{1}{8}\) has been suggested by the error analysis of original method (39) (see Appendix A).

Now, for reasons that we will justify later (see Theorem 4.3 below), we will drop the term

\[
- \sum_{K \in \mathcal{T}_h} \left( \frac{1}{\nu} (\mathcal{B}_K([\nu \partial_n u_1]), \nabla q_1)_K \right)
\]

and analyze (and implement) the following simplified version of (39): Find \((u_1, p_1) \in V_h \times Q_h^1\) such that

\[
B((u_1, p_1), (v_1, q_1)) = F(v_1, q_1) \quad \forall (v_1, q_1) \in V_h \times Q_h^1.
\]

**Remark 4.1.** We see that method (44) has the form of a stabilized method of the GLS class, plus a nonstandard jump term formed by the residual of the Cauchy stress tensor on the edges of the triangulation. This will give us control of this residual, which is exclusive to continuous pressure spaces, since in that case pressure jumps vanish.

**Remark 4.2.** The method is written as the restriction of a consistent method to \(\mathbb{P}^1/\mathbb{P}^1\) elements simply to avoid some technical difficulties. A nonconsistent presentation may be given and in that case we can prove that the consistency error does not imply a loss of precision.

As we said before, we will perform the error analysis of method (44). This is due to the fact that the error of method (39) is bounded by that of (44), as stated in the following result, whose proof may be found in Appendix A.

**Theorem 4.3.** Let \((u, p) \in H^2(\Omega) \times H^1(\Omega)\) be the solution of (1). Then, method (39) is consistent. Moreover, (39) has a unique solution \((\tilde{u}_1, \tilde{p}_1) \in V_h \times Q_h^1\), and the following error estimate holds:

\[
||u - \tilde{u}_1||_h^2 + ||p - \tilde{p}_1||_h^2 \leq C (||u - u_1||_h^2 + ||p - p_1||_h^2),
\]

where \((u_1, p_1) \in V_h \times Q_h^1\) is the solution of (44), and the norms are defined as in (49)–(50) below.
4.1.1. Derivation of the method. Using spaces $V_h$ and $Q_h^1$, (13) reduces to the following: Find $(u_1, p_1) \in V_h \times Q_h^1$ such that

$$\nu(\nabla u_1, \nabla v_1)_\Omega - (p_1, \nabla \cdot v_1)_\Omega + (q_1, \nabla \cdot u_1)_\Omega$$

$$+ \sum_{K \in T_h} \frac{1}{\nu} (M_K(\nabla p_1) - B_K([\nu \partial_n u_1]), \nabla q_1)_K$$

(45) + $\sum_{Z \in \mathcal{E}_h} \frac{1}{\nu} (B_K([\nu \partial_n u_1]), [\nu \partial_n v_1])_Z = (f, v_1)_\Omega + \sum_{K \in T_h} \frac{1}{\nu} (M_K(f), \nabla q_1)_K$

for all $(v_1, q_1) \in V_h \times Q_h^1$. Since $\nabla p_1|_K \in \mathbb{R}^2$, we have

$$M_K(\nabla p_1) = (M_K(e_1), M_K(e_2)) \nabla p_1 = b^p_K \nabla p_1.$$

As in the previous section, we see that $b^p_K = b^p_K I$, where $b^p_K$ is the solution of

$$-\Delta b^p_K = 1 \quad \text{in } K, \quad b^p_K = 0 \quad \text{on } \partial K.$$

Hence

$$(M_K(\nabla p_1), \nabla q_1)_K = \left[ \int_K b^p_K \right] \nabla p_1|_K \cdot \nabla q_1|_K = \frac{(b^p_K, 1)_K}{|K|} (\nabla p_1, \nabla q_1)_K.$$

On the other hand, from the previous section we know that

$$(B_K([\nu \partial_n u_1]), [\nu \partial_n v_1])_Z = \tau_Z ([\nu \partial_n u_1], [\nu \partial_n v_1])_Z,$$

where $\tau_Z$ has been defined in (17). Moreover, if we suppose that $f$ is piecewise constant, we have $M_K(f) = b^p_K f$, and hence, in the same way as before,

$$(M_K(f), \nabla q_1)_K = \frac{(b^p_K, 1)_K}{|K|} (f, \nabla q_1)_K.$$

Summing all this up, we arrive at the following expression for (45): Find $(u_1, p_1) \in V_h \times Q_h^1$ such that

$$\nu(\nabla u_1, \nabla v_1)_\Omega - (p_1, \nabla \cdot v_1)_\Omega + (q_1, \nabla \cdot u_1)_\Omega + \sum_{K \in T_h} \frac{(b^p_K, 1)_K}{|K|\nu} (\nabla p_1, \nabla q_1)_K$$

$$- \sum_{K \in T_h} \frac{1}{\nu} (B_K([\nu \partial_n u_1]), \nabla q_1)_K + \sum_{Z \in \mathcal{E}_h} \frac{(b^p_K, 1)_Z}{|Z|\nu} ([\nu \partial_n u_1], [\nu \partial_n v_1])_Z$$

(47) = $(f, v_1)_\Omega + \sum_{K \in T_h} \frac{(b^p_K, 1)_K}{|K|\nu} (f, \nabla q_1)_K$

for all $(v_1, q_1) \in V_h \times Q_h^1$. Finally, since the mesh is regular by a scaling argument (cf. [31]) we have that

$$\frac{1}{|K|} (b^p_K, 1)_K \sim C_1 h^2_K,$$

where $C_1$ is a positive constant independent of $h$ and $\nu$. Hence, replacing (48) in (47) and defining $\tau_K$ appropriately, we obtain method (39).

Remark 4.4. The assumption of the piecewise constant $f$ on the right-hand side is made simply to derive the method, but it does not affect the precision of it. Indeed, if we consider a general $f \in H^1(\Omega)^2$ and take its projection onto the space of piecewise constant functions, we keep the same order of convergence of the method (see Appendix B).
4.2. Error analysis. Let us consider the mesh-dependent norms

\begin{equation}
\|v\|_h^2 := \nu |v|_{1,\Omega}^2 + \sum_{Z \in \mathcal{E}_h} \tau_Z \|\nu \partial_n v\|_{0,Z}^2,
\end{equation}

(49)

\begin{equation}
\|q\|_h^2 := \sum_{K \in \mathcal{T}_h} \tau_K |q|_{1,K}^2.
\end{equation}

(50)

The first results concern the consistency and well-posedness of stabilized method (44).

**Lemma 4.5.** Let \((u, p) \in [H^2(\Omega) \cap H_0^1(\Omega)]^2 \times [H^1(\Omega) \cap L_0^2(\Omega)]\) be the solution of (1) and \((u_1, p_1)\) the solution of (44). Then,

\[
\mathbf{B}( (u - u_1, p - p_1), (v_1, q_1) ) = 0 \quad \forall (v_1, q_1) \in \mathbf{V}_h \times \mathbf{Q}_h^1.
\]

**Proof.** The result follows from the definition of \(\mathbf{B}\) and the fact that \(\nu \partial_n u = 0\) a.e. on the internal edges. \(\square\)

**Lemma 4.6.** Let \((v_1, q_1) \in \mathbf{V}_h \times \mathbf{Q}_h^1\). Then

\[
\mathbf{B}( (v_1, q_1), (v_1, q_1) ) = \|v_1\|_h^2 + \|q_1\|_h^2.
\]

**Proof.** The result follows from the definition of \(\mathbf{B}\) and the fact that \(\Delta v_1 = 0\) in each \(K \in \mathcal{T}_h\). \(\square\)

Now, in order to approximate the velocity we will consider the Lagrange interpolation operator as in the previous section and for the pressure interpolation we will use the Clément interpolation operator \(C_h\) satisfying (35).

The following approximation result will be useful in what follows.

**Lemma 4.7.** Let \((v, q) \in [H^2(\Omega) \cap H_0^1(\Omega)]^2 \times [H^1(\Omega) \cap L_0^2(\Omega)]\) and \(\tilde{q}_h := C_h(q) - (C_h(q).1)_h\). Then,

\begin{equation}
\|v - I_h(v)\|_h^2 + \sum_{K \in \mathcal{T}_h} \tau_K^{-1} \|v - I_h(v)\|_{0,K}^2 + \nu h_K^2 \|\Delta(v - I_h(v))\|_{0,K}^2 \leq C h^2 \nu |v|_{2,h}^2,
\end{equation}

(51)

\begin{equation}
\|q - \tilde{q}_h\|_h + \frac{1}{\sqrt{\nu}} \|q - \tilde{q}_h\|_{0,\Omega} \leq C \frac{h}{\sqrt{\nu}} |q|_{1,\Omega}.
\end{equation}

(52)

**Proof.** The result follows from the norm definition and using \(\|q - \tilde{q}_h\|_{0,\Omega} \leq \|q - C_h(q)\|_{0,\Omega}\) combined with (26), (27), and (35). \(\square\)

Using Lemmas 4.5–4.7 we can establish the following convergence result.

**Theorem 4.8.** Let \((u, p) \in [H^2(\Omega) \cap H_0^1(\Omega)]^2 \times [H^1(\Omega) \cap L_0^2(\Omega)]\) be the solution of (1) and \((u_1, p_1)\) the solution of (44). Then, the following error estimate holds:

\begin{equation}
\|u - u_1\|_h + \|p - p_1\|_h \leq C \left[ \sqrt{\nu} |u|_{2,\Omega} + \frac{1}{\sqrt{\nu}} |p|_{1,\Omega} \right].
\end{equation}

(53)

**Proof.** Let \(\tilde{u}_h := I_h(u), \tilde{p}_h := C_h(p) - \frac{C_h(p).1}{H} \) and \((\eta^u, \eta^p) := (u - \tilde{u}_h, p - \tilde{p}_h)\). Applying Lemma 4.6 and the consistency of the method, and integrating by parts we
have
\[
\|u_1 - \hat{u}_h\|_h^2 + \|p_1 - \hat{p}_h\|_h^2 = B((u_1 - \hat{u}_h, p_1 - \hat{p}_h), (u_1 - \hat{u}_h, p_1 - \hat{p}_h))
\]
\[
= B((\eta^u, \eta^p), (u_1 - \hat{u}_h, p_1 - \hat{p}_h))
\]
\[
= \nu (\nabla \eta^u, \nabla (u_1 - \hat{u}_h))_{\Omega} - (\eta^p, \nabla \cdot (u_1 - \hat{u}_h))_{\Omega} - (\eta^u, \nabla (p_1 - \hat{p}_h))_{\Omega}
\]
\[
+ \sum_{K \in T_h} \tau_K (-\nu \Delta \eta^u, \nabla (p_1 - \hat{p}_h))_K + \sum_{K \in T_h} \tau_K (\nabla \eta^p, \nabla (p_1 - \hat{p}_h))_K
\]
\[
+ \sum_{Z \in E_h} \tau_Z ([\nu \partial_n \eta^u], [\nu \partial_n (u_1 - \hat{u}_h)])_Z
\]
\[
\leq \left[ \nu |\eta^u|_{1,\Omega}^2 + \frac{1}{\nu} \|\eta^p\|_{0,\Omega}^2 + \sum_{K \in T_h} (\tau_K^{-1} |\eta^u|_{0,K}^2 + \nu^2 \tau_K \|\Delta \eta^u\|_{0,K}^2) \right]^{1/2}
\]
\[
+ \|\eta^p\|_h^2 + \sum_{Z \in E_h} \tau_Z \|[\nu \partial_n \eta^u]\|_{0,Z}^2 \right]^{1/2}
\]
\[
\cdot \left[ 3\nu |u_1 - \hat{u}_h|_{1,\Omega}^2 + 3 \sum_{K \in T_h} \tau_K \|\nabla (p_1 - \hat{p}_h)\|_{0,K}^2 + \sum_{Z \in E_h} \tau_Z \|[\nu \partial_n (u_1 - \hat{u}_h)]\|_{0,Z}^2 \right]^{1/2}
\]
\[
\leq \sqrt{3} \left[ |\eta^u|_h^2 + \sum_{K \in T_h} [\tau_K^{-1} |\eta^u|_{0,K}^2 + \nu h_K^2 \|\Delta \eta^u\|_{0,K}^2] + \|\eta^p\|_h^2 + \frac{1}{\nu} \|\eta^p\|_{0,\Omega}^2 \right]^{1/2}
\]
\[
\cdot \left[ |u_1 - \hat{u}_h|_h^2 + \|p_1 - \hat{p}_h\|_h^2 \right]^{1/2}.
\]
Hence, dividing by the last term and applying Lemma 4.7 we arrive at
\[
\|u_1 - \hat{u}_h\|_h + \|p_1 - \hat{p}_h\|_h \leq C \left[ \nu h^2 |u|_{2,\Omega}^2 + \frac{h^2}{\nu} |p|_{1,\Omega}^2 \right]^{1/2}.
\]
The result follows using triangular inequality and Lemma 4.7 once more. \qed

Remark 4.9. In particular, from the previous theorem we have an \(O(h)\) convergence for \(|u - u_1|_{1,\Omega}\) and \(\sum_{Z \in E_h} h_Z \|[\partial_n (u - u_1)]\|_{0,Z}^2\), which are both optimal in order and regularity.

4.2.1. A convergence result for the pressure. In the last result of the previous section we had an error estimate in the velocity, but, due to the norm definition, we did not guarantee the convergence of the pressure. The next result shows that we have an optimal error estimate in the natural norm of the pressure, which is independent of \(\nu\).

Theorem 4.10. Let \((u, p) \in [H^2(\Omega) \cap H_0^1(\Omega)]^2 \times [H^1(\Omega) \cap L_0^2(\Omega)]\) be the solution of (1) and \((u_1, p_1)\) the solution of (44). Then, the following error estimate holds:
\[
\|p - p_1\|_{0,\Omega} \leq C h \left[ \nu |u|_{2,\Omega} + |p|_{1,\Omega} \right].
\]

Proof. From the continuous inf-sup condition (see [24]), there exists \(w \in H_0^1(\Omega)^2\) such that \(\nabla \cdot w = p - p_1\) in \(\Omega\) and \(|w|_{1,\Omega} \leq C \|p - p_1\|_{0,\Omega}\). Let \(w_h = C_h(w) \in V_h\).
Then, applying the consistency of the method, (35), and previous theorem, we obtain
\[
\|p - p_1\|_{0,\Omega}^2 = (\nabla \cdot w, p - p_1)_\Omega = (\nabla \cdot (w - w_h), p - p_1)_\Omega + (\nabla \cdot w_h, p - p_1)_\Omega \\
= -\sum_{K \in T_h} (w - w_h, \nabla(p - p_1))_K + \nu (\nabla(u - u_1), \nabla w_h)_\Omega \\
+ \sum_{Z \in E_h} \tau_Z \left( [\nu \partial_n (u - u_1)], [\nu \partial_n w_h] \right)_Z \\
\leq \sum_{K \in T_h} \|w - w_h\|_{0,K} \|p - p_1\|_{1,K} + \nu \|u - u_1\|_{1,\Omega} \|w_h\|_{1,\Omega} \\
+ \sum_{Z \in E_h} \tau_Z \left( \|\nu \partial_n (u - u_1)\|_{0,Z} \left( \|\nu \partial_n w_h\|_{0,Z} \right) \right)^{\frac{1}{2}} \\
\leq C \sqrt{h} \left( \|u - u_1\|_\Omega + \|p - p_1\|_h \right) \left( \|w_h\|_{1,\Omega} \right)^{\frac{1}{2}} \\
\leq C \sqrt{h} \left( \sqrt{h} \|u_2\|_\Omega + \frac{1}{\sqrt{h}} \|p\|_{1,\Omega} \right) \|p - p_1\|_{0,\Omega},
\]
where, in order to bound the term \(\sum_{Z \in E_h} \tau_Z \|\nu \partial_n w_h\|_{0,Z}^2\) we have used the local trace result (28) and \(w_h|_K \in P^1(K)^2\). The result follows then by dividing by the last term. \(\square\)

4.2.2. An error estimate for \(\|u - u_1\|_{0,\Omega}\). Throughout this section we will assume that the solution of the following problem, where \((u_1, p_1)\) is the solution of (44), belongs to \([H^2(\Omega) \cap H_0^1(\Omega)]^2 \times [H^1(\Omega) \cap L_0^2(\Omega)]\): Find \((\varphi, \pi)\) such that
\[
-\nu \Delta \varphi - \nabla \pi = u - u_1, \quad \nabla \cdot \varphi = 0 \quad \text{in } \Omega, \\
\varphi = 0 \quad \text{on } \partial \Omega.
\]
We also assume that the following estimate holds:
\[
\nu \|\varphi\|_{2,\Omega} + \|\pi\|_{1,\Omega} \leq C \|u - u_1\|_{0,\Omega}.
\]

**Theorem 4.11.** Under the hypothesis of Theorem 4.10 the following error estimate holds:
\[
\|u - u_1\|_{0,\Omega} \leq C h^2 \left( |u|_{2,\Omega} + \frac{1}{\nu} |p|_{1,\Omega} \right).
\]

**Proof.** Let \((\varphi_h, \pi_h) := (I_h(\varphi), C_h(\pi) - [C_h(\pi), 1]_\Omega) \in V_h \times Q_h^1\). Then, multiplying the first equation in (56) by \(u - u_1\) and the second by \(-(p - p_1)\), from the definition of bilinear form \(B\), the consistency of the method, the fact that \([\partial_n \varphi] = 0\) a.e. on the internal edges, interpolation inequalities (26), (27), and (35), and Theorems 4.8
and 4.10, we obtain
\[
\|u - u_1\|_{0, \Omega}^2 \\
= \nu (\nabla \varphi, \nabla (u - u_1))_\Omega + (\pi, \nabla \cdot (u - u_1))_\Omega - (p - p_1, \nabla \cdot \varphi)_\Omega \\
= B((u - u_1, p - p_1), (\varphi, \pi)) - \sum_{K \in T_h} \tau_K (-\nu \Delta (u - u_1) + \nabla (p - p_1), \nu \Delta \varphi + \nabla \pi)_K \\
= B((u - u_1, p - p_1), (\varphi - \varphi_h, \pi - \pi_h)) \\
- \sum_{K \in T_h} \tau_K (-\nu \Delta (u - u_1) + \nabla (p - p_1), \nu \Delta \varphi + \nabla \pi)_K
\]
\[
\leq \left[ \nu \|u - u_1\|_{0, \Omega}^2 + \nu \|\nabla \cdot (u - u_1)\|_{0, \Omega}^2 + \frac{1}{\nu} \|p - p_1\|_{0, \Omega}^2 \right]^{\frac{1}{2}} \\
+ \sum_{Z \in \mathcal{E}_h} \tau_Z \left( \|\nu \partial_n (u - u_1)\|_{0, Z}^2 + 2 \sum_{K \in T_h} \tau_K \|\nabla (p - p_1)\|_{0, K}^2 \right)^{\frac{1}{2}} \\
+ \left[ \nu \|\varphi - \varphi_h\|_{1, \Omega}^2 + \frac{1}{\nu} \|\pi - \pi_h\|_{0, \Omega}^2 + \nu \|\nabla \cdot (\varphi - \varphi_h)\|_{0, \Omega}^2 \right]^{\frac{1}{2}} \sum_{K \in T_h} \tau_K \|\nabla (\pi - \pi_h)\|_{0, K}^2
\]
\[
\leq C \left[ \|u - u_1\|_{0, \Omega}^2 + h^2 \|\varphi - \varphi_h\|_{2, \Omega}^2 + \|\pi - \pi_h\|_{0, \Omega}^2 \right]^{\frac{1}{2}} \sum_{K \in T_h} \tau_K \|\nabla (\pi - \pi_h)\|_{0, K}^2
\]
\[
\leq C \frac{1}{\sqrt{\nu}} \frac{h^2}{2} \left( \sqrt{\nu} \left\|\nabla \varphi\right\|_{2, \Omega}^2 + \frac{1}{\sqrt{\nu}} \left\|\nabla \pi\right\|_{1, \Omega}^2 \right) \left\|\nabla \varphi\right\|_{2, \Omega}^2 + \frac{1}{\nu} \left\|\nabla \pi\right\|_{1, \Omega}^2 \right)^{\frac{1}{2}} \left\|u - u_1\right\|_{0, \Omega},
\]
and the result follows. \(\square\)

**Remark 4.12.** As we claimed before, the error analysis is independent of the nature of the \(f\) on the right-hand side, and hence, we have actually justified method (44) for a general \(f \in L^2(\Omega)^2\). In Appendix B we will show that if \(f \in H^1(\Omega)^2\), then the difference between implementing method (44) and \((f, v_1)\|_\Omega + \sum_{K \in T_h} \nu^{-1} (M_K(f), \nu \Delta v_1 + \nabla q)_K\) on the right-hand side is smaller than the order of the method. On the other hand, method (44) has been justified for any constant \(C_1 > 0\), even if it has been presented with \(C_1 = \frac{1}{2}\).

**5. An alternative formulation including the residual on the boundary.**
In this section we propose another class of methods arising from a different choice of enrichment functions. We will denote by \(R_h\) the pressure space according to the choice of elements, i.e., \(R_h = Q_h^1\) for \(P^1/P^1\) elements and \(R_h = Q_h^0\) for \(P^1/P^0\) elements. The proposed method reads as follows: Find \((u^e, p^e) \in V_h \times R_h\) such that
\[
B_r((u^e, p^e), (v_1, q)) = F(v_1, q) \quad \forall (v_1, q) \in V_h \times R_h,
\]
where
\[
B_r((u^e, p^e), (v_1, q)) = \nu(\nabla u^e, \nabla v_1)_\Omega - (p, \nabla \cdot v_1)_\Omega + (q, \nabla \cdot u^e)_\Omega \\
+ \sum_{K \in T_h} \tau_K (-\nu \Delta u^e + \nabla p, \nu \Delta v_1 + \nabla q)_K \\
+ \sum_{Z \in \mathcal{E}_h} \tau_Z \left( \|\nu \partial_n u^e + p \mathbf{I} \cdot \mathbf{n}\|_{Z}, \|\nu \partial_n v_1 + q \mathbf{I} \cdot \mathbf{n}\|_{Z} \right),
\]
\( \mathbf{F} \) is given by (42), \( \tau_K \) by (43), and

\[
\tilde{\tau}_Z := \frac{h_Z}{12 \alpha \nu},
\]

where \( \alpha > 0 \) will be fixed in order to have a well-posed problem.

This method may be obtained in the same way as method (14) and (44) by taking the enrichment function \( u_e \) to be the solution of (4), together with the boundary conditions

\[
-\nu \partial_{ss} u_e + p^r \mathbf{I} \cdot \mathbf{n} = \frac{1}{\alpha h_Z} \left[ -\nu \partial_n u_e + p^r \mathbf{I} \cdot \mathbf{n} \right] \quad \text{on each} \ Z \subset \partial K, \quad u_e = 0 \text{ at the nodes},
\]

on the internal edges, and \( u_e = 0 \) on \( \partial K \cap \partial \Omega \). In fact, using this choice of enrichment we can perform the same derivation from sections 3 and 4, neglecting once more a cross term appearing in \( \mathbb{P}_1/\mathbb{P}_1 \) discretization.

**Remark 5.1.** This method is different from (14) and (44) from two viewpoints. First, the boundary term contains the residual of the Cauchy stress tensor on the trial function. This fact comes from the choice of the enriched part as being a corrector for the residual inside the element and on the boundary. The other difference is the stabilization parameter on the edges. Now, this parameter contains a constant to set.

Now, let \( \| \cdot \|_h \) be the mesh-dependent norm defined by:

\[
\| (v_1, q) \|_h := \left[ \nu |v_1|_{1,\Omega}^2 + \sum_{K \in T_h} \tau_K |q|_{1,K}^2 + \sum_{Z \in E_h} \tilde{\tau}_Z \| [q] \|_{0,Z}^2 \right]^\frac{1}{2}.
\]

Then, we have the following coercivity result.

**Lemma 5.2.** Let us suppose that \( \alpha > \frac{C_t}{3} \), where \( C_t > 0 \) is the constant from local trace result (28). Then, for all \( (v_1, q) \in V_h \times R_h \) there holds

\[
B_r((v_1, q), (v_1, q)) \geq \frac{1}{2} \| (v_1, q) \|_h^2.
\]

**Proof.** Let \( (v_1, q) \in V_h \times R_h \). Then, since \( \Delta v_1 = 0 \) on each \( K \in T_h \), applying local trace result (28) and the definition of \( \tilde{\tau}_Z \) we obtain

\[
B_r((v_1, q), (v_1, q)) = \nu |v_1|_{1,\Omega}^2
\]

\[
+ \sum_{K \in T_h} \tau_K \| \nabla q \|_{0,K}^2 + \sum_{Z \in E_h} \tilde{\tau}_Z (-\nu^2 \| [\partial_n v_1] \|_{0,Z}^2 + \| [q] \|_{0,Z}^2)
\]

\[
\geq \nu |v_1|_{1,\Omega}^2 - \frac{C_t}{6 \alpha} \sum_{K \in T_h} |v_1|_{1,K}^2 + \sum_{K \in T_h} \tau_K |q|_{1,K}^2 + \sum_{Z \in E_h} \tilde{\tau}_Z \| [q] \|_{0,Z}^2
\]

\[
\geq \frac{1}{2} \| (v_1, q) \|_h^2,
\]

and the result follows. \( \square \)

Once this method has been proved to be stable, following a procedure absolutely analogous to those from sections 3 and 4 we can prove the consistency of (58) and perform a complete error analysis of (58), obtaining the same results as in previous sections.

6.1. An analytical solution: Convergence validation. For this test case, the domain is taken as the square $\Omega = (0, 1) \times (0, 1)$, $\nu = 1$, and $f$ is set such that the exact solution of our Stokes problem is given by

$$u_1(x, y) = -256x^2(x - 1)^2y(y - 1)(2y - 1),$$
$$u_2(x, y) = -u_1(y, x),$$
$$p(x, y) = 150(x - 0.5)(y - 0.5).$$

We perform convergence analysis for methods (14), (44), and (58) using continuous $P_1/P_1$ and $P_1/P_0$ elements.

6.1.1. The $P_1/P_1$ case. For this case we first depict in Figures 1–2 the convergence history for method (44). The results reproduce our theoretical results showing an $O(h)$ order of convergence for $|u - u_1|_{1, \Omega}$,

$$|[\partial_n(u - u_1)]|_h := \left[ \sum_{Z \in E_h} h_Z \|[\partial_n(u - u_1)]\|_{0,Z}^2 \right]^{\frac{1}{2}}$$

and $\|p - p_1\|_{0, \Omega}$, and an $O(h^2)$ convergence for $\|u - u_1\|_{0, \Omega}$.

![Fig. 1. Method (44): convergence history for $\|p - p_1\|_{0, \Omega}$ and $|u - u_1|_{1, \Omega}$.](image1)

![Fig. 2. Method (44): convergence history for $\|u - u_1\|_{0, \Omega}$ and $|[\partial_n(u - u_1)]|_h$.](image2)
Method (58) is tested next. The results are depicted in Figures 3–4 using $\alpha = 1$, where the results are in perfect accordance with the theoretical results. The justification of this choice for $\alpha$ may be found in Figure 4 (on the right) where we have depicted the behavior of the error in terms of $\alpha$ (using a mesh of around 2500 elements) and we see that for $\alpha \geq 1$ the error is almost independent of $\alpha$, showing that the restriction of Lemma 5.2 is not only theoretical, but at the same time showing that, once we are inside the region predicted by the theory, the performance of the method is independent of $\alpha$.

6.1.2. The $P^1/P^0$ case. For this case we first depict in Figures 5–6 the convergence history for method (14). The results reproduce our theoretical results showing an $O(h)$ order of convergence for $|u-u_1|_{1,\Omega}$, $|\partial_n(u-u_1) + (p-p_0)n||h$ and $\|p-p_0\|_{0,\Omega}$, and an $O(h^2)$ convergence for $\|u-u_1\|_{0,\Omega}$.

Method (58) is tested next. The results are depicted in Figures 7–8 using $\alpha = 1$, where the results are in perfect accordance with the theoretical results, giving an $O(h)$ for $|u-u_1|_{1,\Omega}$, $\|p-p_0\|_{h}$, and $\|p-p_0\|_{0,\Omega}$, and an $O(h^2)$ convergence for $\|u-u_1\|_{0,\Omega}$. Concerning the choice of $\alpha$, the situation now is quite different from that in the previous section. As a matter of fact, since we only control the pressure...
via the jump terms governed by $\alpha$, we can expect the error to grow as $\alpha$ grows, as it is shown in Figure 9 (for a mesh of 2500 elements) where we see that all the errors attain a minimum at $\alpha = 1$ (i.e., using $\tilde{\tau}_Z = \tau_Z$), and then they present a growing behavior. Values larger than 10 have been tested and the behavior is growing in all the errors. Related experiments have been performed using the GLS method (cf. [27]), obtaining similar results.

6.2. The lid-driven cavity problem. For this case we use the same domain as in the previous section, we set $f = 0$, and the boundary conditions $u = 0$ on $\{0\} \times (0, 1) \cup \{(0, 1) \times \{0\}\} \cup \{(1) \times (0, 1)\}$ and $u = (1, 0)^t$ on $(0, 1) \times \{1\}$. In Figure 10 we depict the pressure isovalues for both $P^1/P^0$ and $P^1/P^1$ approximations (using a mesh of around 1000 elements) showing, in both cases, the absence of oscillations.

7. Concluding remarks. In this paper we have analyzed and tested new stabilized finite element methods for the Stokes problem. These new methods arise from multiscale enrichment of the trial space for the velocity coupled with a Petrov–Galerkin strategy. This Petrov–Galerkin strategy makes it possible to perform statical condensation both at the element level and at the interelement boundary level, making the method take the form of a classical stabilized finite element method, containing jump terms on the interior edges of the triangulation, and with the corresponding...
Fig. 7. Method (58): convergence history for $\|p - p_0\|_{0, \Omega}$ and $|u - u_1|_{1, \Omega}$.

Fig. 8. Method (58): convergence history for $|u - u_1|_{0, \Omega}$ and $\|p - p_0\|_{0, \Omega}$.

Fig. 9. Sensitivity of method (58) to $\alpha$. 
stabilization parameter known exactly. Optimal order error estimates were derived using the natural norms, results that were confirmed by the numerical experiments.

Our belief is that our general methodology may be applied to other mixed problems, namely the Darcy and Brinkman flow problems, and to the advection-diffusion equation. This will be the subject of future works.

Appendix A. Proof of Theorem 4.3.

The consistency of the method is immediate from the fact that 
\[
\nu \partial_n u = 0 \text{ a.e. on } \partial K.
\]
To prove the well-posedness of (39), we prove that \( B_1 \) is an elliptic bilinear form. Let \((v_1, q_1) \in V_h \times Q_h^1\); then from Lemma 4.6 we have that

\[
B_1((v_1, q_1), (v_1, q_1)) = \|v_1\|_h^2 + \|q_1\|_h^2 - \sum_{K \in T_h} \frac{1}{\nu} (B_K([\nu \partial_n v_1]), \nabla q_1)_K.
\]

Now, in order to treat the last term above, let us denote by \(Z_1, Z_2, Z_3\) the sides of \(K\), and let, for \(i = 1, 2, 3\), \(b_{K}^{Z_i}\) be the solution of

\[
-\Delta b_{K}^{Z_i} = 0 \text{ in } K, \quad b_{K}^{Z_i} = g_i \text{ on each } Z \subset \partial K,
\]

where \(g_i = 0\) if \(Z_i \subseteq \partial \Omega\), and \(g_i\) is the solution of

\[
-\partial_{nn} g_i = \frac{1}{h_{Z_i}} \text{ in } Z_i, \quad g_i = 0 \text{ on } \partial K - Z_i.
\]

otherwise. First, we remark that from the maximum principle, we have that \(0 \leq b_{K}^{Z_i} \leq \frac{h_{Z_i}}{8}\) in \(K\). On the other hand, it is easy to see that

\[
B_K([\nu \partial_n v_1]) = \sum_{i=1}^{3} b_{K}^{Z_i} [\nu \partial_n v_1]|_{Z_i},
\]

and then, using that \(|K| \leq \frac{h_{Z_i}^2}{2}\) and the inequality \(ab \leq \gamma^{-1} \frac{a^2}{4} + \gamma b^2 (\gamma > 0)\) (denoting
applying the coercivity result and the consistency of the method we arrive at

\[ \|\textbf{B}_K([\nu \partial_n \textbf{v}_1]), \nabla q_1)_K = \sum_{K \in T_h} \left( \frac{1}{\nu} \langle \textbf{b}_{1}, [\nu \partial_n \textbf{v}_1] \rangle_{K}, \nabla q_1 \rangle_{K} \right) \]

\[ = \sum_{K \in T_h} \sum_{i=1}^{3} \left( \frac{1}{\nu} \langle b_{1,K}^{2}, [\nu \partial_n \textbf{v}_1] \rangle_{Z}, \nabla q_1 \rangle_{K} \right) \]

\[ \leq \sum_{Z \in E_h, K \subseteq \omega_Z} \frac{h_Z}{8\nu} \| \nabla \cdot \nabla q_1 \|_{H^1(K)} \| \nabla q_1 \|_{L^2} \leq \gamma^{-1} \sum_{Z \in E_h, K \subseteq \omega_Z} \frac{h_Z}{16\nu} \| \nabla \cdot \nabla q_1 \|_{H^1(K)} \| \nabla q_1 \|_{L^2} \]

\begin{equation}
\leq \gamma^{-1} \sum_{Z \in E_h, K \subseteq \omega_Z} \frac{h_Z}{16\nu} \| \nabla \cdot \nabla q_1 \|_{H^1(K)}^{2} + \gamma \sum_{K \in T_h} \frac{h_K^2}{8\nu} \| \nabla q_1 \|_{L^2(K)}^{2} .
\end{equation}

Hence, choosing \( \gamma = \frac{14}{16} < 1 \) we arrive at

\[ \mathbf{B}_1((\textbf{v}_1, q_1), (\textbf{v}_1, q_1)) \geq \| \textbf{v}_1 \|_{H^1}^2 + \| q_1 \|_{L^2}^2 - \sum_{Z \in E_h} \frac{h_Z}{14\nu} \| \nabla \cdot \nabla q_1 \|_{H^1(K)}^{2} \]

\[ \geq C_*(\| \textbf{v}_1 \|_{H^1}^2 + \| q_1 \|_{L^2}^2) , \]

where \( C_* \) is a positive constant not depending on \( h \) or \( \nu \). Now, for the error estimate, applying the coercivity result and the consistency of the method we arrive at

\[ C_*(\| \textbf{u} - \hat{\textbf{u}}_h \|_{H^1}^2 + \| p - \hat{p}_h \|_{L^2}^2) \leq \mathbf{B}_1((\textbf{u} - \hat{\textbf{u}}_h, p - \hat{p}_h), (\textbf{u} - \hat{\textbf{u}}_h, p - \hat{p}_h)) \]

\[ = \mathbf{B}_1((\textbf{u}, p - \hat{p}_h), (\textbf{u} - \hat{\textbf{u}}_h, p - \hat{p}_h)) \]

\begin{equation}
= - \sum_{K \in T_h} \langle \mathbf{B}_K([\nu \partial_n (\textbf{u} - \hat{\textbf{u}}_h)]), \nabla (p - \hat{p}_h) \rangle_K .
\end{equation}

Finally, proceeding as in (63) it is not difficult to see that

\[ \sum_{K \in T_h} \langle \mathbf{B}_K([\nu \partial_n (\textbf{u} - \hat{\textbf{u}}_h)]), \nabla (p - \hat{p}_h) \rangle_K \]

\[ \leq C \sum_{Z \in E_h} \tau_Z \| \nabla \cdot \nabla (\textbf{u} - \hat{\textbf{u}}_h) \|_{H^1(K)}^{2} + C_* \sum_{K \in T_h} \tau_K \| p - \hat{p}_h \|_{K}^{2} \]

\[ \leq C (\| \textbf{u} - \hat{\textbf{u}}_h \|_{H^1}^{2} + \| p - \hat{p}_h \|_{L^2}^{2}) + C_* (\| \textbf{u} - \hat{\textbf{u}}_h \|_{H^1}^{2} + \| p - \hat{p}_h \|_{L^2}^{2}) , \]

and hence, there exists \( C > 0 \), independent of \( h \) and \( \nu \), such that

\[ \| \textbf{u} - \hat{\textbf{u}}_h \|_{H^1}^{2} + \| p - \hat{p}_h \|_{L^2}^{2} \leq C (\| \textbf{u} - \hat{\textbf{u}}_h \|_{H^1}^{2} + \| p - \hat{p}_h \|_{L^2}^{2}) , \]

and the result follows by triangular inequality.

**Remark A.1.** We have proved that the error of method (39) is bounded by the error of method (44). The same analysis of Theorems 4.10 and 4.11 may be carried out to prove error estimates on \( \| p - \hat{p}_h \|_{0,\Omega} \) and \( \| \textbf{u} - \hat{\textbf{u}}_h \|_{0,\Omega} \).

**Appendix B. The error if \( f \) is not piecewise constant.** As we claimed before, we have assumed that \( f \) is piecewise constant in order to derive (44), but this
assumption does not affect the convergence of the method, and hence (44) may be implemented as it is presented for a general function $f \in L^2(\Omega)^2$. Now, if we do not suppose that $f$ is piecewise constant in the derivation, then method (44) becomes the following: Find $(u_h, p_h) \in V_h \times Q_h$ such that

$$
\mathcal{B}((u_h, p_h), (v_1, q_1)) = F_h(v_1, q_1)
$$

for all $(v_1, q_1) \in V_h \times Q_h$, where $\mathcal{B}$ is defined in (41) and $F_h$ is given by

$$
F_h(v_1, q_1) := (f, v_1) + \sum_{K \in T_h} \frac{1}{\nu} (\mathcal{M}_K(f), \nabla q_1)_K.
$$

Clearly, (65) has a unique solution $(u_h, p_h) \in V_h \times Q_h$. Moreover, the following result holds.

**Theorem B.1.** Let us suppose that $f \in H^1(\Omega)^2$. Then, under the hypothesis of Theorems 4.8, 4.10, and 4.11, the following error estimate holds:

$$
\|u - u_h\|_h + \|p - p_h\|_h \leq Ch \left( \sqrt{\nu} |u|_{2,\Omega} + \frac{1}{\sqrt{\nu}} |p|_{1,\Omega} + \frac{1}{\sqrt{\nu}} \|f\|_{1,\Omega} \right),
$$

$$
\|p - p_h\|_{0,\Omega} \leq Ch \left( \nu |u|_{2,\Omega} + |p|_{1,\Omega} + \|f\|_{1,\Omega} \right),
$$

$$
\|u - u_h\|_{0,\Omega} \leq Ch^2 \left( |u|_{2,\Omega} + \frac{1}{\nu} |p|_{1,\Omega} + \frac{1}{\nu} \|f\|_{1,\Omega} \right).
$$

**Proof.** Let $(u_1, p_1)$ be the solution of (44). First, applying [30, Lem. 5.3.1], we see that

$$
\|u_1 - u_h\|_h + \|p_1 - p_h\|_h \leq \sup_{(v_1, q_1) \in V_h \times Q_h - \{\theta\}} \frac{\mathcal{F}(v_1, q_1) - \mathcal{F}_h(v_1, q_1)}{\|v_1\|_h + \|q_1\|_h}
\leq \sup_{(v_1, q_1) \in V_h \times Q_h - \{\theta\}} \frac{\sum_{K \in T_h} (\tau_K f - \frac{1}{\nu} \mathcal{M}_K(f), \nabla q_1)_K}{\|v_1\|_h + \|q_1\|_h}
\leq \sup_{(v_1, q_1) \in V_h \times Q_h - \{\theta\}} \frac{\sum_{K \in T_h} |\tau_K f - \frac{1}{\nu} \mathcal{M}_K(f)|_{0,K} |q_1|_{1,K}}{\|v_1\|_h + \|q_1\|_h}.
$$

Now, let $f_h$ be the piecewise constant function given by

$$
f_h|_K = \frac{1}{|K|} \int_K f.
$$

This function, which is the (local) projection on the space of piecewise constant functions, satisfies (cf. [17]) $\|f - f_h\|_{0,K} \leq C h_K |f|_{1,K}$. Then, applying triangular inequality we arrive at

$$
|\tau_K f - \mathcal{M}_K(f)|_{0,K} \leq |\tau_K (f - f_h)|_{0,K} + |\tau_K f_h - \frac{1}{\nu} \mathcal{M}_K(f_h)|_{0,K} + \frac{1}{\nu} \|\mathcal{M}_K(f_h - f)|_{0,K}.
$$

The first term is easily bounded using the approximation properties of $f_h$ and the definition of $\tau_K$. Next, since $\mathcal{M}_K(f_h) = b_K^h f_h$ in each $K \in T_h$, the second term is
bounded in the following way:

\[
\| \tau_K f_h - \frac{1}{\nu} M_K(f_h) \|_{0,K} \leq \| \tau_K \| f_h \|_{0,K} + \frac{\| b^p_K \|_{0,K}}{\nu} \| f_h \|_{H^2} \\
\leq \| \tau_K \| f_h \|_{0,K} + \frac{C_K \| b^p_K \|_{1,K}}{\nu |K|^{\frac{1}{2}}} \| f_h \|_{0,K},
\]

where \( C_K > 0 \) is the constant such that \( \| v \|_{0,K} \leq C_K |v|_{1,K} \) for all \( v \in H^1_0(K) \). Furthermore, looking carefully at the behavior of the Poincaré constant \( C_K \) we can see (cf. [30, Thm. 1.2.5]) that \( C_K \leq h_K \). On the other hand, from the definition of \( b^p_K \) we have \( b^p_K \|_{1,K} = \langle b^p_K, 1 \rangle_K \), and then, applying (48) we arrive at

\[
(72) \quad \frac{C_K \| b^p_K \|_{1,K}}{\sqrt{\nu |K|^{\frac{1}{2}}}} \| f_h \|_{0,K} \leq \frac{h_K \sqrt{\langle b^p_K, 1 \rangle_K}}{\sqrt{\nu |K|^{\frac{1}{2}}}} \| f_h \|_{0,K} \leq C \frac{h^2_K}{\nu} \| f_h \|_{0,K}.
\]

To bound the third term in (71) we remark that function \( e := M_K(f - f_h) \) satisfies \( -\Delta e = f - f_h \) in \( K, e = 0 \) on \( \partial K \), and hence

\[
(73) \quad \| e \|_{0,K} \leq C_K \| f - f_h \|_{0,K} \leq h^2_K \| f - f_h \|_{0,K} \leq C h^3_K \| f \|_{1,K}.
\]

Hence, applying (70)–(73) (and assuming \( h \leq 1 \)), we arrive at

\[
\| u_1 - u_h \|_h + \| p_1 - p_h \|_h \leq C \sup_{(v_h, q_1) \in V_h \times Q_h} \frac{\sum_{K \in \mathcal{T}_h} h^2_K}{\sqrt{\sqrt{\nu |K|^{\frac{1}{2}}}}} \| f \|_{1,K} |q_1|_{1,K} \| v_h \|_h + \| q_1 \|_h \\
\leq C \frac{h}{\sqrt{\nu}} \| f \|_{1,\Omega},
\]

and hence (67) follows by triangular inequality and Theorem 4.8. Estimates (68) and (69) are proved as in Theorems 4.10 and 4.11 and by using (67).
